<p>(54) Title: A PHONE HAVING ACCESS TO THE INTERNET FOR THE PURPOSES OF TRANSACTING E-MAIL, E-COMMERCE, AND E-BUSINESS, AND FOR COMMUNICATING VOICE AND DATA</p> <p>(57) Abstract</p> <p>The present invention relates to a public, private, or cellular phone with access to the Internet for the purposes of transacting e-mail, e-commerce, and e-business and for communicating voice and data. In addition the present invention relates to a universal advertising and payment system and method for networking, monitoring and effectuating e-mail, e-commerce, and e-business and controlling vending equipment and applications. The system can effectuate electronic commerce and interactive advertising at the point of sale in this instance at a public, private or cellular phone. Vending equipment includes copiers, phones (public, private, cellular), facsimile machines, printers, data-ports, laptop print stations, notebook computers, palmtop computers (PALM PILOT), microfiche devices, projectors, scanners, cameras, modems, communication access, personal data assistants (PDA's), pagers, and other vending machines, personal computers (PC), PC terminals (NET PC), and network computers (NC). Vending equipment can be networked to each other through a first network, programmable and accessible by a PC, server, point of sale (POS) system, property or management information system (PMS/MIS), and networked to a second network. The first network and second network can be the same network. Complete control of a vending machine's functionality including usage, control, diagnostics, inventory, and marketing data capture can be effectuated locally or by remote connection to the network. Remote connection to the network includes Internet type connections, telecommunication (telephone, ISDN, ADSL), VSAT satellite, and other wire and wireless transmission. The present invention allows a user to obtain authorization for use, pay for products and services, and configure the vending equipment with a smart card, or magnetic card (card). Magnetic cards include phone, smart card, credit card, debit card, pre-paid, automated teller machine (ATM) or other bank or private issued card. Users can also use a hotel room key/card or other insertion type-identifying device. Additionally, biometric identification such as handwriting, voice, finger, hand, or eye (iris scan) can be utilized to control the system.</p>

**A PHONE HAVING ACCESS TO THE INTERNET FOR THE PURPOSES OF
TRANSACTING E-MAIL, E-COMMERCE, AND E-BUSINESS, AND FOR
COMMUNICATING VOICE AND DATA**

RELATED APPLICATIONS

5 This application is a continuation-in-part of U.S. Application Serial No. 09/293,129, filed on April 16, 1999, and U.S. Application No. 09/293,358, filed on April 16, 1999, which are both non-provisional applications claiming priority of U.S. provisional application Serial No. 60/093,475, inventor H. Brock Kolls, entitled UNIVERSAL INTERACTIVE ADVERTISING AND PAYMENT SYSTEM FOR PUBLIC ACCESS ELECTRONIC COMMERCE AND
10 BUSINESS RELATED PRODUCTS AND SERVICES, filed on July, 20, 1998.

TECHNICAL FIELD OF THE INVENTION

15 The present invention relates to a universal advertising and payment system and method for networking, monitoring, collecting data, selling goods and services, controlling interactive advertising, controlling and effectuating electronic commerce and controlling vending equipment including private and public phones. The present invention also relates to physical and virtual networking of private and public phones and network hardware, server based network control, and network security. The present invention can be implemented in a manner to allow operational monitoring and control of networks (and network hardware), vending machines including private and public phones, electronic mail (e-mail), electronic commerce (e-commerce), electronic
20 business (e-business), payment for goods and services, delivery of goods and services, and advertising worldwide.

BACKGROUND OF THE INVENTION

25 The growth of the Internet has created a new way to buy, sell, trade, and barter goods and services worldwide. This new form of buying, selling, trading, and bartering may commonly be referred to as electronic commerce or e-commerce and or electronic business or e-business. The process of conducting these types of transactions can be called an electronic commerce transaction, electronic business transaction, e-commerce transaction, or e-business.

30 In addition, as more business gain access to the Internet the way businesses conduct business may also change. This new form of conducting business on the Internet can be referred to as electronic business, or e-business.

As more individuals and businesses gain access to and or develop a presence on the Internet more goods and services can be made available and offered to buy, sell, trade, and or

- 2 -

barter. Resultant from rapid growth trends in Internet usage, e-commerce transaction and e-business transaction trends may also be increasing.

Prior to recent Internet, e-mail, e-commerce, and e-business trends many companies might have been able to manage business information processes including dissemination of timely 5 information, order processing, and customer support. Traditional businesses including accounting, operations, sales departments, and order fulfillment departments might have been able to expand equally in harmony with new customer generation and increased business sales volume.

A factor in growing and expanding a business equally as well as in managing balanced growth of a company may have been the fact that until the introduction of the Internet traditional 10 advertising means (print, radio, television, etc.) reached limited selected market places. Reaching selected market places in a controlled approach could allow a company to tailor ramping up for increased order processing, order fulfillment, customer service and or increased ways and opportunities for relevant information to be distributed and otherwise be made available.

The dynamics of the Internet can be that a company with an Internet presence, ready or 15 not, can have a worldwide presence overnight to millions of potential customers and shortly thereafter be inundated with orders, customer service issues, merchandise returns, and order fulfillment requirements. The work load may force some companies into a position of being unable to support certain individual and customers needs - at anytime, all the time, anywhere.

In general, the Internet can offer exposure to many millions of potential customers 20 worldwide simultaneously. The result can be receipt of more orders, news, and or information requiring processing, disbursement, and or fulfillment then a company can reasonably handle. This can result in poor performance on the part of the order recipient to timely meet business and customer needs. In many cases this could cause alienation and ultimate loss of a valued or potential business partners, and or customers.

25 As individuals become more reliant on the Internet for e-mail, e-commerce and e-business the demands for access to the Internet may increase. In addition, to the buying, selling, trading, and bartering supported on the Internet other services vital to daily business may also be performed online.

For example, Internet banking, stock and security trading, and e-mail and e-business 30 communication may also be a growing functional need of the Internet. Unfortunately only individuals with access to computers that have Internet connectivity can use these services. In large part this may limit the access to Internet services since many potential users might only have

access to an Internet capable computer at home or at a place of employment. Even if a computer with Internet access is available the opportunity to surf through tens of thousands of Internet web sites may require more time than is available or may be an inappropriate use of time (as may be common in the work place environment).

5 Additionally, a computer with Internet access may be too foreboding in time and or skill required from a potential user in finding the appropriate web site, identifying the goods or services desired, and ultimately conducting an e-mail, e-commerce, or e-business transaction. Furthermore, the potential lack of security of sensitive credit card and transaction information, and other sensitive data may be a real threat in discouraging potential users from performing e-commerce transactions. Thus a potential customer may become scared, and or frustrated choosing not to partake in e-mail, e-commerce, or e-business transactions all together.

10 There are numerous problems for Internet based businesses (referred to as virtual companies or virtual businesses) in that increased competition on the Internet may see their growth diminish. The barrier to entry of a virtual company can be little more than a computer hooked to the Internet. As more web sites appear selling similar products, a virtual company's ability to differentiate itself from other virtual companies may diminish. Head-to-head competition may shrink profit margins, potentially jeopardize an entire business enterprise. In addition, web based business may struggle to uniquely identify themselves – after all most if not all virtual companies exist on web pages, and web pages only.

15 In addition to virtual companies having to compete with other virtual companies, virtual companies have to compete with brick and mortar type companies. Brick and mortar type companies may be referred to as physical companies. Physical companies are companies with physical locations that the public can access.

20 Physical companies may have several advantages over virtual companies. For example, in many cases physical companies can see their competition coming after them by monitoring and counting the competitions physical locations. Furthermore, it is much easier for a company with physical locations to expand by developing an Internet business, then it is for a virtual company to expand by buying or building physical locations.

25 A number of deficiencies support the long felt need of the present invention including the inability of many companies to meet the information distribution and availability demands of businesses and individuals with respect to e-mail, e-commerce, and e-business. In addition, the demands for access to Internet services to timely conduct business and personal related transactions, as well as a wide variety of e-mail, e-commerce, and e-business type transactions can

result in user dissatisfaction, late or incorrect information, lost opportunities, and or lost sales to name a few.

Deficiencies and shortcomings resulting from limited access to computers that have Internet access or connectivity may restrict access to virtual companies. In addition, the lack of 5 Internet access available to everyone prevents a large contingent of potential customers from conducting e-mail, e-commerce, and e-business transactions with virtual companies.

Deficiencies and shortcomings of virtual companies include a lack of ways to differentiate themselves among competing rival virtual companies as well as brick and mortar type physical companies. In addition, the inability of the virtual companies to generate physical point of 10 presence in the public may make virtual companies susceptible to competition from physical companies that decide to diversify by developing a competing virtual business.

SUMMARY OF THE INVENTION

The present invention is embodied in a simple and effective system and method for a universal control and payment system to distribute and display interactive advertising, conduct 15 electronic mail, electronic commerce, electronic business, and control the billing for the use of vending equipment. Vending equipment can include copiers, phones (public, private, cellular), facsimile machines, printers, data-ports, laptop print stations, notebook computers, palmtop computers (PALM PILOT), microfiche devices, projectors, scanners, cameras, modems, communication access, personal data assistants (PDA's), pagers, and other types of vending 20 machines, personal computers (PC), PC terminals (NET PC), and network computers (NC).

One aspect of the present invention provides a system for public access to electronic mail (e-mail), electronic commerce (e-commerce), and electronic business (e-business). More 25 specifically, the present invention can control, monitor, and effectuate e-mail, e-commerce, and e-business transactions such that the general public can use the present invention as a public access electronic commerce station. E-business includes data communication related to business activities, and includes financial related information, and public transportation information.

Another aspect of the present invention provides the ability to route e-mail, e-commerce, and e-business transactions, allowing e-mail, e-commerce, e-business transactions including credit card and other types of transactions to be processed in an online environment.

30 It is understood that both the foregoing general description and the following detailed description are exemplary, but are not restrictive of the invention.

BRIEF DESCRIPTION OF FIGURES

The present invention is best understood from the following detailed description when read in connection with the accompanying drawings. Included in the drawings are the following Figures:

5 Figure 1 shows a flowchart illustrating a high level chart of the invention;

Figure 2 shows an example of a public personal computer system;

Figures 3A-3D shows a plurality of business center configurations showing system 500 integration;

Figure 18 shows an error detection routine 1600 flowchart;

DETAILED DESCRIPTION OF THE INVENTION

Figure 1 shows an overview of the universal interactive advertising and payment system for vending of public access electronic commerce and business related products and services. The universal interactive advertising and payment system is a computer program which may reside in a carrier, such as a disk, diskette or a modulated carrier wave.

A vending machine is defined as any piece of equipment in which products and/or services can be rendered therefrom. Referring again to Figure 1, control of a vending machine (referred to as VENDING MACHINE USAGE) can involve a first step of denying usage, access, service, or products from the vending machine as shown in step 10. Next, in step 20 the system accepts user input (data and/or monetary, disclosed herein as PRE-VEND TRANSACTION DATA (i.e. "AUTHORIZATION")), and then in step 30, the system authenticates or verifies the user's input to determine if VENDING MACHINE USAGE is "authorized." If, in step 40, VENDING MACHINE USAGE is "authorized" the processing proceeds to step 50. In step 50, the system effectuates the delivery, monitoring, and dispensing of the product, and/or service. Then, in step 10 60, the system processes the POST-VEND TRANSACTION DATA to effectuate user (customer) billing, and account maintenance. Lastly, in step 70, the system "settles" (effectuates the transfer 15 of funds, i.e. payment) the POST-VEND TRANSACTION DATA.

Step 70 can be optional when a PRE-VEND TRANSACTION can both satisfy the requirements of step 40, "authorization" and step 70, "settling." Examples of when Step 70 may 20 not be required, can include vending of a product or service when at the time of creating the PRE-VEND TRANSACTION DATA (i.e. the "authorization") the exact amount of the total sale is known. Other examples of when step 70 may not be required can include creating PRE-VEND TRANSACTION DATA (i.e. the "authorization") where no bill for the product or service will be incurred by the user (customer) (i.e. products and/or services for a particular user are "free").

25 One example of a vending machine is shown in Figure 2, a personal computer system, known as a system 100. The arrangement on table 129 is comprised of a PC 102, a monitor 128, a transaction control device 108 (shown in an exemplary embodiment as a combination of a magnetic card terminal 136 and debit card reader-writer 134 packaged together), a keyboard 110, a modem 114, a mouse 112, a printer 104 and a controller 106.

30 A reliable way to govern the use of a PC system and its various components is to effectuate control of the mouse 112, keyboard 110, printer 104, modem 114, telecommunication lines (phone, ISDN, asymmetric digital subscriber line) and other peripheral devices. A PC system which has a mouse and keyboard under regulated control of a transaction control device

108 (such transaction control device capable of placing the mouse and keyboard in an inoperable state) can effectively prevent unauthorized use of the PC system. With an inoperable keyboard, an unauthorized user can not make typographic input. Furthermore, an inoperable mouse prevents an unauthorized user from selecting functions or features, entering selections or choices or 5 executing control of software programs. To further enhance and secure a PC system, regulating control of other components of the PC system can also be implemented.

A transaction control device 108 is defined as any device that can accept coins, currency, magnetic cards, phone card, smart cards, credit cards, debit cards or other value storing medium and is capable of communicating a set of qualifying/disqualifying data or enabling/disabling data 10 to a second control device. Transaction control devices such as a debit card reader-writer, a coin or currency activated device or a credit card terminal provide a means for indicating to external peripheral devices that a set of satisfying criteria has been met and allowance of system use is granted (an enabling signal).

Figures 3A-3D show an exemplary embodiment for the present invention, an unattended 15 business center in which product and services can be vended. The control of a vending machine can include monitoring and accounting for products and services rendered from the vending machine. Vending machines can include copiers such as copiers 602A-602F, phone/data-port combinations such as phone 648, facsimile machines such as fax 604A-604B, and printers such as printer 104 and printer 612A-612G. Other types of vending machines can include, laptop/palm 20 computer print stations such as laptop print station 646, microfiche devices (not shown), projection equipment (not shown), scanners (not shown), and digital cameras (not shown). Additionally, peripherals such as personal computers (PC) 102/630, personal computer terminal (NET PC) 630, and network computer (NC) 630, as well as traditional vending machines can be referred to generally as vending machines.

A personal computer (PC)-PC terminal (NET PC)-network computer (NC) 630 can be a 25 PC 102 and can be a PC-NET PC-NC 630A-630D. PC-NET PC-NC 630A-D and PC 102 can be referred to as PC-NET PC-NC 630 or generally as a PC 630. A NET PC can be a PC with a network connection to a server. Furthermore, a NET PC can rely and utilize services remotely over the network. NET PC services can include software, access to the Internet, access to remote 30 locations, access to other online services, as well as access to other data transmission mediums. These additional transmission mediums can include a telecommunication service (wired and wireless), a telephone, integrated service digital network (ISDN), an asymmetric digital subscriber line (ADSL), a very small aperture transmission (VSAT) satellite, a cable modem, and

a T1 telecommunication line. An NC is a network computer reliant on a server for many computing functions. Such computing functions can include remote software access, access to the Internet, remote locations, other online services, as well as access to other data transmission 5 mediums such as telecommunication service (wired and wireless), telephone, ISDN, ADSL and VSAT satellite. Furthermore, the NC can rely on an on-site, off-site remote, Internet, or other data connections to establish data communications with a single server or multiple servers.

PC 630 can be a specialized PC, which through software prevents a user from functionally using the PC 630 until a satisfying condition or state, is presented. Upon receipt of the satisfying criteria, PC 630 by way of software intervention allows a user to functionally use the PC 630. A 10 unique feature of this form of PC is that while software grants and denies access to the PC system, software continues to oversee the user's activities, choosing to intervene and prevent the user from performing certain functions. Functions that can be blocked are those that comprise system security, including access to hardware, access to hardware settings, access to software, and or access to software settings. This specialized form of a PC 630 can generally be referred to as a 15 public PC. For purposes of disclosure this form of PC will be referred to as a PC 630.

Vended products from a vending machine can include usage time, device usage count, printed output, copies, printed pages, fax transmissions, and other related supplies (e.g. food, beverage, staplers, film, rubber bands, paper clips, note pads, computer disks, pens, and pencils). Vended services from a vending machine can include charging for usage time of a PC-NET PC- 20 NC 630, charging for usage time of online services, access to program applications, or databases, and charging for electronic commerce transactions.

A public access electronic commerce terminal is a computing device, such as a system 500. A public access electronic commerce terminal can be referred to as an electronic commerce terminal. A public access electronic commerce terminal can effectuate control of a vending 25 machine as required while allowing a user of the system to view, vend, respond to, or purchase from displayed interactive advertising. Furthermore, a user can make general inquiries and obtain other information related to the interactive advertising from a public access electronic commerce terminal. A system 500 can be a public access electronic terminal. A system 500 can also be a transaction control device, such as a transaction control device 108. An E-PORT manufactured by 30 USA TECHNOLOGIES can be a system 500.

The ability to view, vend, obtain information, respond to, or purchase from displayed interactive or electronic advertising by way of an electronic computing device is generally referred

to as an electronic commerce transaction or as electronic commerce. A system 500 can also be an electronic computing device.

A typical business center can be comprised of a plurality of vending equipment. A business center can include a copier 602A, a fax machine 604A, a laptop/palmtop print station 646, a data-port/phone 648, and a PC-NET PC-NC 630 (PC 630). Furthermore, many business centers and retail outlets (store or location) require a plurality of copiers 602, a plurality of faxes 604, a plurality of PCs 630, and other vending equipment to meet the needs of their customers. A control system, and operational method which can interface and control a plurality of different types of vending equipment is also required. It is also desirable that each vending machine is networked to share resources and reduce undue duplication, and expense of equipment. For example, when printing a customer receipt is required, a single printer on the network can allow a plurality of vending machines to share the single printer. Furthermore, networking vending machines in a business center, or a retail outlet facility enables shared transaction processing capabilities and allows system integration with existing POS, PMS/MIS, and other network systems. A management information system (MIS) can be a POS system or a PMS system.

Referring again to Figures 3A-3D, there is shown an unattended business center, which includes a plurality of systems 500. Referring to Figure 3A, there is shown a system 500 with a first display means 582, a smart card reader/writer 548, a keypad 540 and a magnetic card acceptor 550. Additional interface components (not shown) can be interfaced to system 500 to allow the acceptance of other identity forms such as keys, and biometrics.

Referring to Figure 3B, there is shown business center furniture, referred to as table 129 on which is shown a copier 602A interconnected with a system 500B. A system 500B can be a system 500. Also shown on table 129 is a printer 612A, data-port/phone 648, a smart card re-value station 638, and a laptop/palmtop print station 646 interconnected with a system 500C. A system 500C can be a system 500. A re-value station 638 can be a system 500. A data-port/phone 648 can include or be operated by a system 500. Also shown is a server 632 interconnected with a telecommunication line 642. Telecommunication line 642 can be a VSAT connection or other network type connection.

Referring to Figure 3C, there is shown a computer workstation to illustrate a plurality of exemplary embodiments of how a system 500 can be integrated into, and control the use of a PC 630. Although in an exemplary embodiment only a single system 500 is required to effectuate control of a PC 630, several systems 500 are shown to illustrate how a system 500 can be mounted, or implemented to control a PC 630 in a variety of exemplary ways.

- 10 -

5 A computer desk referred to as table 129 is shown on which is placed a printer 104, and a keyboard 110. Also, on table 129 there is shown a PC 630. A system 500 can be integrated into the PC 630, whereby control of PC 630 can be effectuated. Furthermore, there is shown a monitor 128 with a system 500 integrated into the monitor 128, whereby control of a PC 630 can be effectuated. There is also shown a system 500 mounted to the table 129, whereby control of a PC 630 can be effectuated. Additionally, there is shown in Figure 3D a keyboard 110 with a system 500 integrated into keyboard 110, whereby control of a PC 630 can be effectuated.

10 Referring to Figure 3E there is shown a phone 180 with a system 500. A phone 180 can be a system 500. Furthermore, a phone 180 can be operationally related to a system 500. In addition, a phone 180 can be a public, private, wireless phone or cellular phone or other similar types of telecommunication device. Suitable phone 180 can include those manufactured by GENERAL ELECTRIC, AT&T, NYNEX, SPRINT, MCI, BELL TELEPHONE (BELL SOUTH, BELL ATLANTIC, ETC.), SONY, AUDIOVOX, QUALCOM, ERICKSON, MOTOROLA, 3COM, SHARP, PANASONIC, TEXAS INSTRUMENTS, CABLE AND WIRELESS, LDI, or other telephone manufacturers or suppliers. A phone 180 is a specific type of phone 648. A phone 180 can be a phone 648.

15 Referring to Figure 3F there is shown a cellular phone 182 with a system 500. A cellular phone 182 can be a system 500. A cellular phone 182 can be operationally related to a system 500. Alternatively, a cellular phone 182 can be integrated with, but separate from a system 500. Suitable cellular phone 182 can include those manufactured by GENERAL ELECTRIC, AT&T, NYNEX, SPRINT, MCI, BELL TELEPHONE (BELL SOUTH, BELL ATLANTIC, ETC.), SONY, AUDIOVOX, QUALCOM, ERICKSON, MOTOROLA, 3COM, SHARP, PANASONIC, TEXAS INSTRUMENTS, CABLE AND WIRELESS, LDI, or other cellular telephone manufacturers or suppliers. A phone 182 is a specific type of phone 648. A phone 182 can be a phone 648.

25 A phone 180, and a cellular phone 182 can be referred to as a data-port/phone 648.

20 There is shown in Figure 4, a system 500. The system 500 includes numerous mutually exclusive control means. In a plurality of customer specifications and where customer cost considerations demand, there may arise a situation where a system 500 may not contain or require the use of certain features or functions. Accordingly, a system 500 can easily be manufactured to include or exclude a specific combination of control means to produce the desired control result at a desirable cost to a customer. For example, a customer may desire to operate a system 500 without an infrared communications means 502. In such a case, a system 500 could be

manufactured with the omission of specific control means, such as infrared communications means 502. In any combination, the same inclusion or exclusion of control means can be applied to other control means and to the system 500 in general.

Interconnected with a microcontroller 532 is an infrared communications means 502 whereby data communication between microcontroller 532 and a device external to a system 500 can data communicate. A microcontroller 532 can be a controller 106 and can be implemented with a ZILOG Z83C9320FSC or a ZILOG Z8038220FSC. An infrared communications means 502 can be implemented with an infrared remote control receiver module, such as a LITEON LT1033, and an infrared light emitting diode (LED) for transmitting data, such as a LITEON LT1062 LED.

Figure 5 shows a network 600, implementing a plurality of systems 500 together with a PC 630, a server 632, a PMS/MIS 620 and a POS system 614. In an exemplary embodiment, a hand-held device, such as a palmtop computer, by way of infrared communications means 502 can access the network and all systems 500 connected to the network. Furthermore, a hand-held device by way of infrared communications means 502 can data communicate with a server 632 and/or a POS system 614 and/or PMS/MIS system 620 and/or a PC 630. In addition, a hand-held device can data communicate by way of infrared communications means 502 with any vending equipment attached to a first local area network (LAN) 622 and/or a second local area network (LAN) 626 by way of a LAN connection means 556.

In an exemplary embodiment, the use of a LAN can provide necessary network functionality. It is understood by one skilled in the art of network design that other acceptable network architectures could be employed to produce satisfactory results. For example, a wide area network (WAN) could be substituted, or used in combination with a LAN. For purposes of this disclosure all network architecture schemes will be generally referred to as a local area network (LAN).

In an exemplary embodiment, a service technician with a hand held device could record system readings and program functionality of any system 500 controller and/or a network server. By using a hand-held device to data communicate with infrared communications means 502, a technician can upload or download data including program code, service data, transaction data, and other operational data.

Interconnected with microcontroller 532 is a light emitting diode (LED) indicator means 504, whereby multicolored LED's can be utilized to indicate to a user the "status," "state," or "process step" of a routine or function. An example of a "status" function for LED indicator

means 504, can be the "on-line" or "off-line" status of a printer attached to the printer interface 530. An example of a "state" indication, by way of LED indicator means 504, can be a "out-of-order" indicator LED illuminating when equipment or the system 500 is "out-of-service." An example of a "process step" function by way of LED indicator means 504, can be a first step indicator illuminating to indicate a "request for authorization", a second step indicator illuminating to indicate an "approved authorization - preparing equipment for use", and a third step indicator illuminating to indicate the "equipment is ready for use." An LED indicator means 504 can be implemented by way of a plurality of PANASONIC LN21RPHL (red LED), LN31GPHL (green LED), and LN41YPHL (amber LED) LED's.

10 Interconnected with microcontroller 532 is an equipment control means 506. The equipment control means 506 enables and disables the vending equipment for use responsive to customer identification "authorization" by way of a smart card, debit card, credit card, or other input identification means. An equipment control means 506 can be implemented with at least one relay, such as an OMRON relay #G2V-1-DC5, and/or at least one opto-isolator, such as
15 QUALITY TECH #MID400QT.

20 In an exemplary embodiment, a vending machine such as a printer 104, PC 630, a projector (not shown), fax machine 604A or copier 602A can be controlled by way of equipment control means 506. Such control can be effectuated by activating and deactivating a switching device (a switching device can be an integrated part of the equipment control means 506), such as relay, or a transistor, or other control circuit operationally responsive to microcontroller 532.
25 Control of a vending machine can be facilitated by way of a switching device in a first state activating a circuit or setting a first state within the vending machine allowing the vending machine to function normally. Furthermore, the vending machine can be deactivated for use, by way of a switching device, in a second state, breaking a circuit or setting a second state within the vending machine, disabling the vending machine's functionality.

25 Interconnected with microcontroller 532 is a vend counter/timer means 508. The vend counter/timer means 508 independently counts and/or times events that occur external to system 500. Microcontroller 532 by way of the vend counter/timer means 508 can program functionally of the vend counter/timer means 508. Furthermore, vend counter/timer means 508 can monitor the status of a vend cycle, counts of vending events, and frequency of cycles wherein a rate, or rate change over a time period if required. Additionally, counter/timer means 508 can monitor time intervals, where vending price may depend on the length of time, a function, feature or

vending machine is in use by a customer. A vend counter/time means 508 can be implemented with a ZILOG #Z80-CTC, and or a QUALITY TECH #MID400QT opto-isolator.

Interconnected with microcontroller 532 is a keyboard and mouse control means 510. In an exemplary embodiment, a keyboard/mouse control means 510 can be implemented with 5 clamping voltages (for PC keyboard and PS2 style mouse) and mono-polar transmission voltages (for serial style mouse).

Interconnected with microcontroller 532 is a printer/modem control means 512. In an exemplary embodiment, a printer/modem control 512 enables and disables usage of a printer and modem, responsive to control signals from microcontroller 532. The PC by way of system 500 10 can share the printer with the system 500, such that both the PC and system 500 can print to the printer. The PC by way of system 500 can share the modem with system 500, such that both the PC and system 500 can use the modem for remote data communications.

Interconnected with microcontroller 532 is a telephone interface control means 514. In an exemplary embodiment system 500 by way of telephone interface control means 514 enables and 15 disables the usage of a telecommunication line. A telephone interface control means 514 can be implemented as previously disclosed as telecommunication control means 312. Furthermore, telephone interface control means 514 can include a SILICON SYSTEMS 75T202-IP DTMF decoder, whereby microcontroller 532 by way of telephone interface control means 514, detects the telephone number being dialed by a vending machine, such as a fax, PC 630, data-port/phone 20 648, or smart card re-value station 638.

Interconnected with microcontroller 532 is an electrically erasable read only memory ("EEROM") 516. Such an EEROM 516 can be a MICROCHIP 93LC66 serial EEROM. Interconnected with microcontroller 532 is a non-volatile memory 518. Such a non-volatile 25 memory 518 can be a DALLAS SEMICONDUCTOR DS1643-120 or DS-1743. Furthermore, the DS1643-120 or DS-1743 can provide a non-volatile date and time function whereby microcontroller 532 can be responsive to events based on date and time and date and time stamp transactions as they occur.

Interconnected with microcontroller 532 is a microcontroller monitor 520. Such a 30 microcontroller monitor 520 can be a DALLAS SEMICONDUCTOR DS1232. Microcontroller monitor 520 provides a power-on reset signal to microcontroller 532. A reset signal can be applied to microcontroller 532 when the power supply voltage applied to the microcontroller monitor 520 falls outside a specific range of voltage (preset within the microcontroller monitor

520). A reset signal can also be applied to microcontroller 532, should microcontroller 532 fail to provide a reset signal to a watchdog clock time-out counter within microcontroller monitor 520.

Interconnected with microcontroller 532 is a hardware security interface means 522.

Hardware security interface means 522 includes a closed loop interface. A loop of wire can be 5 woven through a series of devices such as a keyboard 110, mouse 112, monitor 128 and PC 630. An "alarm condition" results if the wire loop is electrically broken. Further, hardware security interface means 522 includes a plurality of tilt sensors, wherein tilt or motion sensors can be placed on a plurality of vending equipment and peripherals. An alarm signal is resultant if the tilt sensors are activated (excessive tilting occurs). Furthermore, an "alarm condition" service 10 request can be data communicated by way of the LAN network connection means 556 to any destination location, remote or on the network. Alarm destination locations can include a front desk, security office, owner of the retail store, police or other vending device such as a server 632, a POS system 614, a PMS/MIS system 620 or a PC 630. A hardware security interface means can be implemented with CAROL hook-up wire type C2064. ANAMET INDUSTRIAL, 15 INC. strip wound hose type stainless steel UI (armored cable) can be used to enclose and protect the security wire loop. Tilt can be measured by a COMUS INTERNATIONAL #CA20-0 or a FIFTH DIMENSION #TS7-0 mercury switch.

Interconnected with microcontroller 532 is an alarm means 524. An alarm means 524 can be implemented using a PANASONIC piezoelectric ceramic buzzer #EFB-RL37C22. In an 20 exemplary embodiment, a single enclosure fastened to a vending machine can contain a system 500, a hardware security interface means 522 (including motion and/or tilt sensors), and an alarm means 524. Motion of the vending machine imparts motion of fastened system 500 causing a tilting "alarm condition." Alternatively, an enclosure not fastened to a vending machine containing a system 500, hardware security interface means 522, and alarm means 524 can have 25 motion and/or tilt sensors fastened to a vending machine external to the system 500 enclosure interconnected as required for desirable operability.

Interconnected with microcontroller 532 are relay switches 526. Relay switches 526 can be utilized for general-purpose load and signal switching being responsive to control signals from microcontroller 532. A general-purpose relay switch 526 can be implemented by way of an 30 OMRON G5V-1-DC5 or an OMRON G3B-1174P-US-DC5 (for high current loads).

Interconnected with microcontroller 532 is a solenoid control means 528. Solenoid control means 528 is responsive to control signals from microcontroller 532 and can effectuate driving of a solenoid. In an exemplary embodiment, the solenoid control means 528 is responsive

- 15 -

to a system 500 detecting an "out-of-supply" condition of a vending machine and opening a supply door/drawer to allow a customer to restock the vending machines. Supplies can include paper, ink and toner for a copier, printer, fax, or PC. In another exemplary embodiment, the solenoid control means 528 can lock and unlock the business center furniture, such as table 129, when 5 circumstances require. In another exemplary embodiment, a solenoid control means 528 can lock and unlock a retail store location essentially granting access to a 24-hour area of the store. A solenoid control means 528 can be implemented by way of a QUALITY TECH triac output opto-isolator #MOC3010QT and or a QUALITY TECH gated triac Q2015L5, and/or a GUARDIAN solenoid.

10 Interconnected with microcontroller 532 is an auxiliary terminal interface control means 530 for interfacing with a transaction control device 108.

15 Interconnected with microcontroller 532 is a plurality of input devices including a voice and/or handwriting capture and recognition means 534, a bar code reader 536, a fingerprint/palm/hand reader biometric means 538, and a keypad 540. Each of these input devices performs the indicated function independent of microcontroller 532 and by way of data 20 communications with microcontroller 532 data communicates results of the input function to microcontroller 532 for interpretative post processing. Handwriting capture and analysis processing allows a system 500 to capture a customer's signature. Operating on the captured signature an analysis or customer validating process can be performed. Furthermore, the captured signatures can be utilized for authorization of the transaction and for credit card processing 25 purposes.

25 A keypad 540 can be a touch screen. A voice and/or handwriting capture and recognition means 534 can be a touch screen. A suitable touch screen can be a part number TPI PN 1059-001 manufactured by TRANSPARENT PRODUCTS, INC.. In addition, a touch screen controller part number ADS7843 manufactured by EURR BROWN can be utilized to implement a keypad 540.

30 Interconnected with microcontroller 532 is a personal computer memory card industry association (PCMCIA) interface 542. Industry standard PCMCIA compliant devices can be plugged into the PCMCIA interface 542 and data communicate with microcontroller 532. In an exemplary embodiment, a hand-held device, notebook computer, laptop/palmtop computer, modem or other data communication means or other data processing equipment (generally referred to as other data processing equipment) can by way of PCMCIA interface 542 access network 600. Access to the network can selectively include other systems 500, vending machines, servers, VSAT communications, or any other device or communication means connected to the network

600. Furthermore, other data processing equipment by way of PCMCIA interface 542, can data communicate with a server 632, POS system 614, PMS/MIS system 620, or PC 630. Other data processing equipment can data communicate by way of the PCMCIA interface 542 with any vending machine or other device attached to the first LAN network 622 or the second LAN
5 network 626 by way of a system 500 interconnected with said vending machine.

As an example, a service technician desiring to record network system readings or program functionality of a system 500 controller or network server (referred to as a "universal server") can do so by way of PCMCIA interface 542. With a hand-held device, notebook computer, laptop computer, palmtop computer, or other data processing device interconnected to
10 the PCMCIA interface 542 the technician can upload or download data including program code, service data, and other operational data.

The term "universal server" is defined as a server, network server or data processing device capable of supporting data communication with other data processing devices. Further, a universal server can be a PC 630, PMS/MIS or POS system, or other dedicated computing device.
15 A system 500 can be a universal server. A universal server can reside on a network 600 locally or remotely. There can be more than one universal server on a network 600. In addition, a single universal server can monitor and control numerous different (related or unrelated) networks 600. In this fashion, a single universal server or multiple universal servers can monitor an unlimited number of networks 600 worldwide. Processing and data communications can occur between
20 different networks 600 that have a universal server in common. Processing and data communication between more than one universal server can occur. Additionally, data communication between more than one independent network 600 can occur by way of a plurality of universal servers data communicating with each other. A universal server can have data connection means to the Internet, be an Internet based server (a web server) or be an Internet
25 based data storage or processing device.

Interconnected with microcontroller 532 is a modem 544. Modem 544 can be used to data communicate with remote locations, such as a credit bureau, other service processing centers, other servers, or other data communicating devices (including other systems 500). A modem 544 can be a CERMETEK CH1786LC modem.

30 Interconnected with microcontroller 532 is a plurality of card and key readers and writers including smart card reader/writer 548, magnetic card reader/writer 550, debit card reader/writer 552 and a hotel room key/card interface 554. Each interface accepts a form of customer identification and data communicates with microcontroller 532. A smart card reader/writer 548

can be a GEMPLUS GCR400, or a GEMPLUS GCI400, or a NEURON MSR-100, or a NEURON MSR-270 series. A magnetic card reader/writer 550 can be a XICO 7102ESA, or a XICO 6272SA, or a NEURON MSR-100, or a NEURON MSR-270 series, or a NEURON MCX-370-1R-0101. A debit card reader/writer 552 can be a DEBITEK, DAYNL, SCHLUMBERGE, 5 ACT, XCP, ITC, COPICARD brand of debit card reader/writer, or other transaction control device 108.

Interconnected with microcontroller 532 is a local area network (LAN) network control means 556. A LAN network connection means 556 includes a wireless communication means 558, a carrier current communication means 560 and a hardwired communication means 562. A 10 wireless transceiver means 558 can be a WIRELESS TRANSACTION CORPORATION WCC-1200, WTC-1300, STU-200, or a STU-300. A carrier current communication means 560 can be effectuated with traditional carrier current technologies, or spread spectrum technologies. Such a communication means 560 can be implemented as desired and known to one skilled in the art. A hardwired transceiver control means 562 can be implemented by way of the RS232 standard serial 15 communication, or RS485 serial communication. RS485 data communication can be effectuated with a pair of wires (DATA "A" wire and DATA "B" wire). Further, a hardwired communication means 562 can be implemented using Ethernet, token ring, TCP/IP, Net Buoy or other networking scheme as is known to one skilled in the art.

In an exemplary embodiment the LAN network connection means 556 allows vending 20 equipment to be located in permanent or temporary "stationary locations," "in-room locations" and on "mobile carts." A mobile cart PC 630, copier 602A or fax 604A can be located pool side, in a recreation area, or in a hotel room and remain connected to the LAN network by way of LAN connection means 556, wireless communication means 558, carrier current communication means 560, or hardwired communication means 562.

25 Interconnected are a first communication means 564 and a second communication means 566. The first and second communication means 564 and 566 can be PARALLEL, RS232, RS485, PCMCIA, LAN or other standard communication ports. Interconnection to peripheral devices can include printers, network controllers, hand-held devices, and PC's 630. A first and second communication means 564 and 566 can be implemented with a SIPEX SP235A (RS232 - 30 TTL converter) or a MAXIM MAX244CQH, and/or a MAXIM MAX481 (RS485 converter).

Interconnected with microcontroller 532 is a parallel interface 568. By way of parallel interface 568, microcontroller 532 can data communicate bi-directionally with other data devices. Parallel interface 568 can support standard parallel communication formats including ECC and

ECP formats. Networking with other PC's 630 can also be effectuated by way of parallel interface 568.

Interconnected with microcontroller 532 are voice record and playback means 570. An interconnection exists between the voice recorder and playback means 570 and a microphone 572.

5 A further interconnection exists between the voice recorder and playback means 570 and a speaker 574. Data communication to system 500 by way of LAN network connection means 556 can include bi-directional voice and video data communications. Microcontroller 532, voice record and playback means 570, microphone 572, speaker 574, camera 578, and, optionally, other elements of system 500 can be combined for an interactive user response system. The interactive 10 user response system allows users of the system to effectively communicate data, voice, audio, and video over the systems and network described herein.

In an exemplary embodiment, an intercom system can be operationally established between a plurality of systems 500 and a PC 630, server 632, POS system 614, PMS/MIS system 620, or other central location (like the front desk in a hotel, security office, etc.). Voice record 15 and playback means 570 including a microphone 572 and a speaker 574 can be implemented with an OKI SEMICONDUCTOR MSM9841 or a OKI SEMICONDUCTOR MSM6585RS, a PANASONIC #WM-034BY electric condenser microphone cartridge, and a PANASONIC #EAS-3P128A micro speaker.

In an exemplary embodiment, a customer/user can respond to an advertisement displayed 20 on the first or second display means 580 or 582. By way of LAN network connection means 556 a customer can be connected with a sales organization, a help desk, or an information center (in general an ORGANIZATION). By interactively communicating with the organization by way of microphone 572, speaker 574, camera 578 and the first or second display means 580 and 582, a customer can obtain product, service, or other information. Should a customer decide to buy, or 25 should a payment or identification (ID) be necessary, a customer can present appropriate ID at smart card reader/writer 548, magnetic card reader/writer 550, debit card reader/writer 552, room key/card interface 554 or any other appropriate input to system 500. Appropriate identification means can include ID, credit card, smart card, cash, coin, debit card, or biometric input. In an exemplary embodiment, goods and services can be purchased, and electronic commerce 30 effectuated between a user, a system 500, and a location, site, and organization (local or remote).

Interconnected with microcontroller 532 is a first display means 582. First display 582 can be a liquid crystal display (LCD), wherein transaction information and advertising can be displayed. A first display 582 can be implemented by way of an OPTREX #DMF-5002NY-EB

super-twist graphics module, or an OPTREX #DMC-6204NY-LY liquid crystal display, or a OPTREX #DMF-50944NCU-FW-1 and an EPSON SED1354FOA LCD controller.

Interconnected with microcontroller 532 is a video record and playback means 576. An interconnection exists between video record and playback means 576 and a camera 578. A further interconnection exists between the video record and playback means 576 and a first display means 582 and a second display means 580. In an exemplary embodiment, a video intercom system can be operationally established between a plurality of systems 500 and a PC 630, server 632, POS system 614, PMS/MIS system 620, or other central location (like the front desk in a hotel, security office, etc.). Video record and playback means 576 including camera 578, a first display means 582, and a second display means 580 can be implemented with a PANASONIC #BS7259L black and white CCD camera, a cathode ray tube (CRT) monitor, a OPTREX #DMF-5002NY-EB super-twist graphics module, and/or an OPTREX #DMC-6204NY-LY liquid crystal display, or a OPTREX #DMF-50944NCU-FW-1 and an EPSON SED1354FOA LCD controller.

In an exemplary embodiment, a plurality of systems 500 can be connected to a plurality of vending machines. Furthermore, a plurality of systems 500 can be networked together with a PC 630, a server 632, a PMS/MIS 620, or a POS system 614. There is shown in Figure 5, a network schematic 600, referred to as network 600, implementing a plurality of systems 500 networked together with a PC 630, a server 632, a PMS/MIS system 620, and a POS system 614. Any number of vending machines and vending machine types can be controlled by way of a plurality of systems 500. Any number of servers, POS systems, PMS/MIS systems, and remote locations can be controlled by way of network 600.

In an exemplary embodiment, a plurality of systems 500 independently data communicate with a server 632, a POS system 614, a PMS/MIS system 620, or a PC 630. As previously disclosed a server 632, a POS system 614, a PMS/MIS system 620, and a PC 630 that gives remote access to any of these types of devices including Internet access by way of a PC 630 or VSAT connection, will be generically referred to as a universal server. A universal server can also be a system 500.

Interconnected with a copier 602A can be a system 500B. A system 500B can be a system 500. Further, interconnected with a copier 602B can be a system 500F. A system 500F can be a system 500. A further interconnection exists between system 500B and the first LAN 622. A further interconnection exists between system 500F and the second LAN 626 by way of a concentrator 608. A further interconnection exists between the concentrator 608 and the second LAN 626.

Concentrator 608 can be a system 500, whereby a plurality of systems 500 can interconnect with a single concentrator 608. Implementing a concentrator 608 allows fewer direct system 500 interconnections to the first LAN 622 or the second LAN 626. Furthermore, when a plurality of systems 500 are interconnected with a concentrator 608, data communication to any 5 individual system 500 by way of a concentrator 608 is unimpeded. Furthermore, such data communication by way of a concentrator 608 is transparent to the first LAN 622, and/or the second LAN 626, and/or the systems 500, which are interconnected with the concentrator 608.

The first LAN 622 and the second LAN 626 can be the same LAN, and/or alternatively different LANs. Furthermore, when the first LAN 622, the second LAN 626, and any other LAN 10 are to be interconnected, to become the same LAN, an interconnection between a plurality of separate LANs can be perfected by way of at least two wireless transceivers 603A and 603B. In an exemplary embodiment, a type of wireless transceivers 603A and 603B can be radio frequency RF type, spread spectrum type, carrier current type, and/or other wired or wireless data communication type methodologies.

15 Interconnected with a fax machine 604A can be a system 500C. A system 500C can be a system 500. Interconnected with a fax machine 604B can be a system 500G. A system 500G can be a system 500. A further interconnection exists between system 500C and the first LAN 622. A further interconnection exists between system 500G and the second LAN 626 by way of a concentrator 608.

20 Interconnected with the fax machine 604A, by way of the system 500C, is a remote location 636. Alternatively, fax machine 604A can interconnect and data communicate with remote location 636 without the need of a system 500C. Remote location 636 can be an online service, Internet site, credit bureau, database, service center, or other remote location. Remote 25 location 636 can be located on-site in relative geographic proximity to fax machine 604A or off-site geographically located anywhere in the world. Furthermore, the fax machine 604A can data communicate with remote location 636 by way of standard network protocols, by way of an Internet type connection, modem, ISDN, ADSL, VSAT satellite communication, dedicated hardware connection, TCP/IP, other network means, or other wired or wireless communication means. Furthermore, remote location 636 can simultaneously manage data communications 30 between any number of networks 600 and remote location 636. Data communications can also be facilitated between different networks 600 geographically located anywhere in the world by way of two or more networks 600 having in common shared data communication resources with a remote location 636.

Interconnected with a PC 630A can be a system 500A. A system 500A can be a system 500. Interconnected with a PC 630B can be a system 500E. A system 500E can be a system 500. A further interconnection exists between system 500A and the first LAN 622. A further interconnection exists between system 500E and the second LAN 626 by way of a concentrator 5 608.

Interconnected with the PC 630A is a remote location 606. Remote location 606 can be an online service, Internet site, credit bureau, database, service center, or other remote location. Remote location 606 can be located on-site in relative geographic proximity to PC 630A or off-site 10 geographically located anywhere in the world. Furthermore, the PC 630A can data communicate with remote location 606 by way of standard network protocols, by way of an Internet type connection, modem, ISDN, ADSL, VSAT satellite communication, cable modem, T1 telecommunication line, dedicated hardware connection, TCP/IP, other network means, or other wired or wireless communication means. Additionally, remote location 606 can simultaneously manage data communications between any number of networks 600 and remote location 606. 15 Data communications can also be facilitated between different networks 600 geographically located anywhere in the world by way of two or more networks 600 having in common shared data communication resources with a remote location 606.

Interconnected with a debit card/re-value station 610 can be a system 500H. A system 500H can be a system 500. A further interconnection exists between system 500H and the second 20 LAN 626, by way of the concentrator 608. The debit card/re-value station 610 can be in the form of a customer service kiosk, or a general service kiosk.

In an exemplary embodiment, a customer can purchase, and/or re-value/transfer value or otherwise re-value and/or obtain a valid "ready-to-use" form of ID (to activate a system 500). For example, a customer can present credit card, cash, coin, or other currency means and obtain a 25 debit card, smart card or other ID form. Access to products and services from the vending machines controlled by way of network 600 can then be obtained with the valid form of ID. A customer can also present a credit card, cash, coin, or other currency means and transfer value/credit/cash to a smart card, or other form of ID. A customer can also present a valid ID to purchase business supplies. Business supplies available from the debit card/re-value station 610 30 can include postage stamps, staplers, paper clips, paper supplies, writing utensils, binding and presentation materials, and other business related products.

Interconnected with a printer 612A is the first local area network (LAN) 622. The printer 612A can be a system 500 in combination with a printer, or print mechanism. In an exemplary

embodiment, a printer 612A can be a general-purpose printer for use by a customer, and/or any system 500 device on network 600. Any vending machine or universal server on the first LAN 622 or the second local area network (LAN) 626 can also access and data communicate with the printer 612A. Applications for the printer 612A can include general-purpose printing, transaction receipt printing, hotel/retail outlet summary report printing, advertisement printing, coupon printing, computer/notebook/laptop/palmtop printing, and hotel/retail outlet activity report printing.

Interconnected with a printer 612B is the second LAN 626. The printer 612B can be a system 500 in combination with a printer. In an exemplary embodiment, a printer 612B can be a general-purpose printer for use by a customer, and/or any system 500 on network 600. Furthermore, any vending machine or universal server on the first LAN 622, or the second LAN 626 can utilize printer 612B. Applications for the printer 612B can include general purpose printing, transaction receipt printing, hotel/retail outlet summary report printing, advertisement printing, coupon printing, computer/notebook/laptop/palmtop printing, and hotel/retail outlet activity report printing.

The printer 612A and the printer 612B are independently accessible, programmable and network functional. Furthermore, any number of printers 612A, or 612B can be interconnected on network 600, each of said printers 612A, 612B being independently accessible, programmable and network functional. In an exemplary embodiment, sufficient quantities of printer 612A, or 612B can be interconnected with the network 600 to best serve customer convenience.

Interconnected with a pre-paid telephone card vending (re-value and/or dispense) machine 624 can be a system 500J. A system 500J can be a system 500. A further interconnection exists between the system 500J and the first LAN 622. In an exemplary embodiment, the pre-paid telephone card vending machine 624 can effectuate the dispensing and re-valuing of pre-paid telephone cards. In addition to the pre-paid telephone card's intended use of operating a telephone, the pre-paid telephone card can also be utilized as an ID form to access, by way of a system 500, vending equipment interconnected with a system 500 and network 600.

Interconnected with vending machine 640 that dispenses goods, services, food, or beverage can be a system 500K. A system 500K can be a system 500. A further interconnection exists between the system 500K and the first LAN 622. In an exemplary embodiment, the food and beverage vending machine 640 can effectuate the dispensing of goods and services, food and beverage products.

Interconnected with an information/Internet kiosk 628 is the second LAN 626. The information/Internet kiosk 628 can include a system 500 in combination with a PC 630 or other computer data communication equipment. In an exemplary embodiment, the information/Internet kiosk and a system 500 interconnected in combination with the information/Internet kiosk 628 can 5 effectuate electronic commerce transactions (payment, shipping, ordering, etc.). Additionally, such a system can provide access to and can effectuate transactions for products and services including other on-line, and/or off-line transactions (i.e. travel information, coupons, advertising, general use, entertainment, business, etc.).

Interconnected with a PMS/MIS system 620 can be a system 500D. A system 500D can 10 be a system 500. A further interconnection exists between the system 500D and the first LAN 622. In an exemplary embodiment, the PMS/MIS system 620 can allow centralized programming and control of the network 600. The PMS/MIS system 620 can manage data processing needs of the network 600, can store and allow modification of vending machine settings, and implement gathering and maintain marketing, customer survey and other informational databases. 15 Furthermore, PMS/MIS system 620 can support transaction processing, and/or implement the universal server functionality.

Interconnected with the management information system 620 is a remote location 618. Remote location 618 can be an online service, Internet site, credit bureau, database, service center, or other remote location. Remote location 618 can be located on-site in relative 20 geographic proximity to management information system 620 or off-site geographically located anywhere in the world. Further, the management information system 620 can data communicate with remote location 618 by way of standard network protocols, by way of an Internet type connection, modem, ISDN, ADSL, VSAT satellite communication, cable modem, T1 telecommunication line, dedicated hardware connection, TCP/IP, other network means, or other 25 wired or wireless communication means. Furthermore, remote location 618 can simultaneously manage data communications between any number of networks 600 and remote location 618. Additionally, data communications can be facilitated between different networks 600 geographically located anywhere in the world by way of two or more networks 600 having in 30 common shared data communication resources with a remote location 618.

Interconnected with a point of sale (POS) system 614 can be a system 500I. A system 30 500I can be a system 500. A further interconnection exists between the system 500I and the first LAN 622. In an exemplary embodiment, the POS system 614 can allow centralized programming control of the network 600, while managing and retaining all current in-store programming and

functionally. The POS system 614 can manage data processing needs of the network 600, can store and allow modifications of vending machine settings, and can implement gathering and maintain marketing, customer survey and other informational databases. Further, POS system 614 can support transaction processing, and/or implement the universal server functionality.

5 Interconnected with the POS system 614 is a remote location 616. Remote location 616 can be an online service, Internet site, credit bureau, database, service center, or other remote location. Remote location 616 can be located on-site in relative geographic proximity to the POS system 614 or off-site geographically located anywhere in the world. Further, the POS system 614 can data communicate with remote location 616 by way of standard network protocols, by
10 way of an Internet type connection, modem, ISDN, ADSL, VSAT satellite communication, cable modem, T1 telecommunication line, dedicated hardware connection, TCP/IP, or other network means, or other wired or wireless communication means. Additionally, remote location 616 can simultaneously manage data communications between any number of networks 600 and remote location 616. Data communications can also be facilitated between different networks 600
15 geographically located anywhere in the world by way of two or more networks 600 having in common shared data communication resources with a remote location 616.

Interconnected with a server 632 is the first LAN 622. A server 632 can be a system 500. In an exemplary embodiment, the server 632 can allow centralized programming control of the network 600, while managing and retaining all current in-store programming and functionality.
20 The server 632 can manage data processing needs of the network 600, can store and allow modifications of vending machine settings, and can implement gathering and maintain marketing, customer survey and other informational databases. Also, server 632 can support transaction processing, and/or implement the universal server functionality.

25 Interconnected with a smart card re-value station 638 is the second LAN 626. A smart card re-value station can be a system 500. The smart card re-value station 638 can accept a valid form of ID, and/or currency. Furthermore, the smart card re-value station 638 can data communicate by way of the auxiliary terminal control means 530, to a smart card. Additionally, by way of the universal server and/or the dynamic identification interchange (DII) the smart card re-value station 638 can add or subtract value (monetary/credit/units) from a smart card. (The
30 dynamic identification interchange is further disclosed in Figure 11 in the transaction routing routine 900, block 908.) The smart card re-value station 638 can also display the available amount of value (monetary/credit/units) available and currently stored on, or accessible by the smart card. A user can also select an amount to operate on (credit/debit) by way of a keypad 540.

- 25 -

Additionally, a user can select the amount to add, subtract, or transfer from the smart card and from other banking, credit accounts, or other databases by way of smart card re-value station 638 preprogramming, universal server settings, or other input means. In an exemplary embodiment, the smart card re-value station 638 can, by way of the universal server and/or the DII transfer funds to and from, or between account(s), bank account(s), credit bureau(s), or other databases. The accounts or databases can be on-site, off-site, and/or accessible by way of remote location 606, 616, 618, 634, 636, or network 600.

Interconnected with the server 632 is a remote location 634. Remote location 634 can be an online service, Internet site, credit bureau, database, service center, or other remote location. Remote location 634 can be located on-site in relative geographic proximity to server 632 or off-site geographically located anywhere in the world. The server 632 can also data communicate with remote location 634 by way of standard network protocols, by way of an Internet type connection, modem, ISDN, ADSL, VSAT satellite communication, cable modem, T1 telecommunication line, dedicated hardware connection, TCP/IP, other network means, or other wired or wireless communication means. Furthermore, remote location 634 can simultaneously manage data communications between any number of networks 600 and remote location 634. Additionally, data communications can be facilitated between different networks 600 geographically located anywhere in the world by way of two or more networks 600 having in common shared data communication resources with a remote location 634.

The remote location 606, remote location 616, remote location 618, remote location 634, and remote location 636 can be the same remote location. Also, remote location 606, remote location 616, remote location 618, remote location 634, and remote location 636 can be data communicated to with similar or dissimilar data communication types or means. Furthermore, remote location 606, remote location 616, remote location 618, remote location 634, and remote location 636 can be different remote locations with different services or different functionality.

Interconnected with access control terminal 650 is the second LAN 626. Access control terminal 650 can be a system 500. In an exemplary embodiment, an access control terminal can be utilized to accept ID and grant access to secured areas. For a retail location that has a 24-hour access area, an access control terminal 650 can be used to allow the general public to present ID to be verified and to enter the secured area. Acceptable forms of identification can include a smart card, or a magnetic card (i.e. phone, credit card, debit card, pre-paid, automated teller machine (ATM) or other bank or private issued card), hotel room key/card or other insertion type

identifying devices. Additionally, biometric input such as handwriting, voice, finger, palm, hand, eye (iris scan) identification can also be an acceptable forms of ID.

There is shown in Figure 6A-6B, a floor plan illustrating how a network 600 with a plurality of vending machines and a plurality of systems 500, could be implemented in a retail location or in a hotel. Referring to Figure 6A, a representative floor plan of a retail location offering business services 229 is shown. Referring to Figure 6B, a representative floor plan of a hotel offering business service 238 is shown. Hotel rooms 244 illustrate how business products and services can be made available within a hotel room. Business Center/Lobby Area/Conference room 240 illustrates how business products and services can be made available in dedicated areas of a hotel. Additionally, the front desk area 242 is shown with copier 602B and Fax 604B shown behind the front desk. In an exemplary embodiment, hotel operations copier, faxes, PC's and other vending machines can be connected to a network 600 and all business equipment (public use and private use) can be monitored, controlled and audited.

There is shown in Figure 7A-7C, a plurality of exemplary embodiment interconnection schemes between a PC 630, a system 500, and a local area network (LAN), such LAN can be the first LAN 622, or the second LAN 626. Referring to Figure 7A, there is shown a PC 630 with a system 500 built into the PC 630. A further interconnection exists between the system 500 and the LAN, such as first LAN 622 or second LAN 626. PC 630 can be responsive to the system 500, and controllable by the system 500. Furthermore, both the system 500 and the PC 630 (by way of the system 500) can data communicate over the first LAN 622.

Referring to Figure 7B, there is shown a system 500 external to a PC 630. The system 500 can be mounted to another object or located in another object such as a being integrated into a keyboard, monitor or other device. An interconnection exists between the system 500 and the PC 630. A further interconnection exists between the system 500 and a LAN, such a LAN can be the first LAN 622 or the second LAN 626. PC 630 can be responsive to the system 500, and controllable by the system 500. Furthermore, both the system 500 and the PC 630 (by way of the system 500) can data communicate over LAN 622.

Referring to Figure 7C, there is shown a PC 630 interconnected with the LAN. Such a LAN can be the first LAN 622, or the second LAN 626. In this exemplary embodiment, a separate system 500 is not required. In this embodiment, the PC 630 provides the necessary functionality to integrate to the LAN. In this embodiment, functionality of the system 500 resides in software and hardware of the PC 630. As required by the application, the system 500 can be (as required) physically or otherwise integrated in the PC 630. This embodiment is particularly

useful in original equipment manufacturing (OEM), wherein it may be desirable to build the system 500 functionality directly in to the PC 630 at the time of manufacturing to minimize the integration work, system testing, and cost of the entire system.

There is shown in Figure 8, a security configuration implemented by way of a system 500. A system 500 by way of a security interface means 522 and a wire loop 146 is interconnected with a PC 630, scanner 118, keyboard 110, printer 104, modem 114, and a mouse 112.

In an exemplary embodiment, all equipment accessible to the public is interconnected with wire loop 146. Electrical continuity status of wire loop 146 is data communicated to the universal server, and other systems 500. In the event the continuity of wire loop 146 changes, such as wire loop 146 is electrically broken, system 500 can still perform appropriate tasks. Appropriate tasks include sounding alarms, locking access doors, and utilizing network 600 to notify authorities (police, fire, security, front desk, retail store owner), and or data communicating with data communicating devices. Data communicating to devices can include other systems 500, such as access control 650.

Referring to Figure 9A-9B, there is shown a customer transaction routine 700. Processing begins in block 702 where a "capture a transaction" command is initiated. A "capture a transaction" command is initiated when a customer/user (generally referred to as a user) inserts a valid form of ID. Valid forms of ID's can include a smart card, or a magnetic card (i.e. phone, credit card, debit card, pre-paid, automated teller machine (ATM) or other bank or private issued card), hotel room key/card or other insertion type identifying devices. Additionally, biometric input such as hand writing voice, finger, palm, hand, eye (iris scan) identification can also be an acceptable forms of ID. Processing then moves to decision block 704.

Processing in decision block 704 determines if valid ID data was received (presented by the user) in response to a "capture a transaction" initiated command. If the resultant is in the affirmative, that is the user has presented valid ID and the data from the ID has been recorded, then processing moves to block 706. If the resultant is in the negative, that is no valid ID was presented, the processing is returned to the calling routine.

Processing in block 706 creates a transaction record based in part on the recorded ID data. Transaction processing can then proceed as programmed in several different formats. In a first transaction process a PMS/MIS or POS system can process the transaction data and determine the validity of the transaction to continue "approved" use or "denied" use of the vending equipment. Any suitable method of transaction verification can be employed including local or remote

databases, credit bureaus, corporate accounts, in-store accounts, or very important person (VIP) memberships to name a few.

5 In a second transaction process, a server, such as a universal server can process the transaction data and determine the validity of the transaction to continue "approved" use or "denied" use of the vending equipment. Any suitable method of transaction verification can be employed including local or remote databases, credit bureaus, corporate accounts, in-store accounts, or very important person (VIP) memberships to name a few.

10 In a third transaction process, a PC 630 can be used to determine validity of the transaction to continue "approved" use or "denied" use of the vending equipment. Any suitable method of transaction verification can be employed including local or remote databases, credit bureaus, corporate accounts, in-store accounts, or very important person (VIP) memberships to name a few. In an exemplary embodiment, such a transaction processing method could effectuate the use of Internet based data connections, intranet, extranet, telecommunication line such as phone, ISDN, ADSL, or VSAT satellite communications. The transaction processing can be
15 transparent and undetectable to a user of PC 630.

20 When transaction processing is complete and a resultant of the transaction process is determined, processing moves to decision block 708. In decision block 708, a test is performed to determine if the use of the vending equipment has been authorized. If the resultant is in the affirmative, that is the resultant of the transaction processing is "approved," then processing moves to block 712. If the resultant of the transaction processing is in the negative, that is the resultant of the transaction processing is "declined," then processing moves to block 710.

Processing in block 710 informs the user that the transaction-processing attempt was "declined." Processing control is then returned to the calling routine.

25 Processing in block 712 informs the user the transaction processing was "approved" and enables the vending for use. During use, relevant marketing data, and advertisements can be displayed on the system 500 interconnected with the vending machine. Relevant marketing data can include current date and time, location, total sale amount, and where appropriate total copies, faxed pages, time used, PC usage, online usage, electronic commerce charges, total prints and other relevant marketing data. Processing then moves to block 714.

30 Processing in block 714 refreshes the display as advertisement, or marketing data change. Processing then moves to block 716 of Figure 9B.

Processing in block 716 allows advertising to be displayed on each system 500 or vending machine capable of displaying advertising. Advertisements can be distributed and displayed at any time during the vend cycle.

5 In an exemplary embodiment, a universal server distributes advertising content over a network 600. When an advertisement is routed to a system 500 or vending machine currently in use, the system 500 or vending machine in use, determines if an advertisement can be displayed. If an advertisement can be displayed at the current time then the advertisement is displayed. The routing criterion attached to the advertisement determines which systems 500 or vending machines will accept and display the advertisement.

10 For example, if a tennis shoe advertisement is globally distributed and routed to all systems 500 then each system 500 or vending machine that can, will accept and display the advertisement. Alternatively, an advertisement can be target marketed to a selected group of systems 500 and vending machines. For example, it is desirable to distribute and display "run" an advertisement for a multifunction fax machine. The fax machine is target marketed to the small 15 office-home office ("SOHO") market. By distributing the advertisement globally with attached routing criterion to only "run" the advertisement on systems 500 and vending machines in retail stores that specialize in SOHO related business services then the advertisement will only be "run" in that market on those systems 500 and vending machines. Routing criterion can be utilized to distribute and manage advertising content by way of any universal server, over any network 600, 20 to any system 500 or vending machine capable of displaying such advertisements. Processing then moves to block 718.

25 Processing in block 718 allows a user to purchase by electronic commerce, transaction items advertised and displayed on any system 500 or vending machine capable of displaying the advertisements. The electronic commerce transaction can be processed as previously disclosed in processing block 706. Processing then moves to decision block 720.

Processing in decision block 720 tests to see if any authorization amounts or other system limit settings have been reached or exceeded. If the resultant of the test is in the affirmative, that is an authorization amount or system limit has been reached or exceeded, then processing moves to block 722. If the resultant is in the negative, that is an authorization amount or system limit has 30 not been reached or exceeded, then processing moves to block 724.

Processing in block 724 data communicates with the universal server. The universal server can effectuate control of the system 500, request certain data be transmitted, or conduct other types of data communication as appropriate. Processing then returns to block 712.

Processing in block 722 can re-authorize transaction data. The users can be prompted to present ID again or choose to allow the same transaction data to be reprocessed. Alternatively, a user can terminate a transaction. Should a user decide to present ID or give consent to a re-authorizing of previous transaction data, processing moves to block 706. If a user decides to 5 terminate the transaction or the universal server or system 500 or vending machine decides to terminate the transaction, processing moves to block 726.

Processing in block 726 terminates a transaction by disabling the appropriate vending machines and printing a transaction receipt. Printing of a receipt can be optional or at the user's request. Processing then moves to block 728.

10 Processing in block 728 data communicates with the universal server. The universal server can effectuate control of the system 500, request certain data be transmitted, or conduct other types of data communication as appropriate. Processing is then returned to the calling routine.

15 Referring to Figure 10, there is shown a service routine 800. To handle a variety of service issues, a plurality of systems 500 can independently request a response from a universal server. Networks may vary from location to location with respect to the type and quantity of vending equipment, and systems 500 networked. Furthermore, remedies to problems such as "out of supplies," and appropriate responses to "alarm conditions" can vary in accordance with a particular location desire, specification, or business policy. With the vast combinations and 20 variations in appropriate responses to service requests initiated by a system 500, in an exemplary embodiment, it is desirable that the universal server responds in accordance with the programmed desires of the network administrator/location.

25 Through non-limiting example, reliance on a universal server to administer service responses to a plurality of systems 500 begins processing in block 802. The universal server is interconnected with a plurality of systems 500 and a plurality of vending machines by way of a first LAN 622 and/or a second LAN 626. In block 802 the universal server, PMS/MIS 620 or POS system 614, or PC 630 determines if a service condition has been requested by a system 500 or a vending machine connected to the network 600. Such service conditions can include out of supply, determination of a lengthy period of time without usage, inability to successfully complete 30 a transaction, and inability to print a receipt. In addition, security alerts and other service conditions can be transmitted for processing. Processing then moves to block 804.

Processing in block 804 interprets a service request and transmits a response to the individual system 500 requesting service. The transmitted response can serve as an

acknowledgement of receipt of the request or can serve as an instruction to take action, or correct a problem.

As an example, if a system 500 were to request a response to "out-of-paper" error detection, the universal server by way of programming by the network administrator can respond to the requesting system 500. The response to the requesting system 500 could be an "open paper supply drawer" command. By way of solenoid control means 528 the requesting system 500 can "open the supply door" and prompt the user to restock the paper supply. Processing then moves to block 806.

Processing in block 806 data communicates with the universal server and can transmit a plurality of responses to take affirmative action to any appropriate system 500 on the network 600. An individual system 500 can data communicate with a second system 500 to "signal" awareness of the service condition and resolve the service condition.

As an example, if a system 500 were to request a response to "security breach" error detection, the universal server by way of programming by the network administrator can respond to the requesting system 500, or any other system 500 on the network 600. The response to the appropriate system 500 could be a "lock the 24-hour access front door" command. By way of solenoid control means 528 the appropriate system 500 can "lock the 24-hour access front door." In addition, the universal server can use "appropriate means" to contact the police or storeowner to report that a theft may be in progress. Appropriate means for the universal server could include interfacing to the in-store security system.

As a second example, if a system 500 were to request a response to a "general alarm condition" as might be detected by way of hardware security interface means 522 the universal server could respond. The response from the universal server could be an affirmative action command to "sound an alarm" at a remote location such as a front desk or security office. In addition, commands could be transmitted to the remote site to activate a warning system in proximity to the universal server or in proximity to the system 500 detecting the "general alarm condition." If the "general alarm condition" is in error or the threat is no longer present then the universal server can data communicate to the plurality system 500 or warning systems requesting service to "deactivate and reset" the hardware security interface means 522, including alarm means 524. The universal server can take additional affirmative action. Contact to a remote site can be initiated. Remote sites can include the front desk of a hotel, security office, or police station.

5 The universal server can use any means available by way of network 600 to initiate contact with a remote location. For example, the universal server could by way of modem 544, voice record and playback means 570 (including microphone 572, and speaker 574), and video record and playback means 576 (including camera 578, first display means 582, and second display means 580) communicate with a security agency. Processing moves to block 808.

Processing in block 808 interprets data communication broadcast on network 600 by a plurality of systems 500. Individual system 500 may request service data to be entered into a service database controlled by the universal server.

10 For example, when a system 500 detects that a transaction has concluded on a particular vending machine controlled by said system 500, a transaction complete service record can be sent to server 632. Server 632 in accordance with programming from a network administrator may store the record in a transaction database, and respond to the service request from the said system 500 by data communicating an acknowledge signal. A server 632 can be a universal server. Processing moves to block 810.

15 Processing in block 810 allows the universal server to broadcast a service message to either an individual system 500, a subset of all systems 500 or all systems 500 on a network 600. A broadcast service message can include changing system 500 or vending machine operating parameters (such as pricing). A universal server can place a system 500 or vending machine in or out of service or choose to print on a network 600 printer. The systems 500 can respond to a 20 service broadcast with an acknowledgement of a message received or a request to re-send the service broadcast. All network 600 data communications are in accordance with established network protocol programming. Processing then returns to the call routine.

25 There is shown in Figure 11, a transaction routing routine 900. Processing begins in decision block 902, wherein transaction data is evaluated to determine if it is PRE-VEND or POST-VEND transaction data. If the resultant is that the transaction data is PRE-VEND transaction data, that is the customer has not yet used the vending equipment for a product or service, processing moves to block 904. If the resultant is that the transaction data is POST-VEND transaction data, that is, the customer has previously been authorized to use the vending equipment and has now concluded the vending transaction, processing moves to block 914.

30 In block 904, any acceptable form of identification (ID) presented by a customer or other person in any system 500 connected to the first LAN 622 or the second LAN 626 is read/processed/measured/extracted/obtained or otherwise recorded. Acceptable forms of identification can include a smart card, or a magnetic card (i.e. phone, credit card, debit card,

5 pre-paid, automated teller machine (ATM) or other bank or private issued card), hotel room key/card or other insertion type identifying devices. Additionally, biometric input such as handwriting, voice, finger, palm, hand, eye (iris scan) identification can also be an acceptable form of ID. For disclosure purposes, a first and second LAN 622 and 626 is generally referred to as a network 600. Processing then moves to block 906.

In block 906, the identification data obtained in block 904 by the presentation of an acceptable form of ID is data communicated to universal server by way of the first LAN 622 and/or the second LAN 626. Processing then moves to block 908.

10 Processing in block 908 checks a routing table resident within the universal server. A routing table determines if a transaction "swap data step, append data step, convert data step, route data step, and/or process data step" is required. Said transaction "swap data step, append data step, convert data step, route data step, and/or process data step" processing is referred to as a dynamic identification interchange (DII). The DII process accepts a first identification form/transaction form and substitutes the first form for a second form. For example, a hotel room
15 key/card may be accepted as a first form of ID and in a DII processing step substituted for or appended to a second form of ID, a credit card. This process can allow a user to have goods and services billed to a credit card by being identified first with a hotel room key/card. Processing then moves to block 910.

20 In an exemplary embodiment, a user registered with a hotel may present as a first form of ID a fingerprint and in a DII processing step have a hotel PMS/MIS system substitute or append a room number as a second ID form. When the user has completed use of the vending machine, a bill can then be posted to a hotel room record within the hotel's PMS/MIS system.

25 In another exemplary embodiment, a customer can present an ACCESS card (such as a smart card) as a first form of ID. The universal server can evaluate the ID form as presented and grant access to an unattended 24-hour access area. The same form of ID can then be presented in a variety of vending machines. Upon the presentation of the first form of ID in these vending machines the DII processing can substitute or append a second form of ID, an in-store account number. As the customer uses a plurality of vending machines for goods and services transaction billing can be posted to the in-store customer's account.

30 In another exemplary embodiment, a customer can present a first form of ID requesting to use a vending machine. Through DII processing it may be determined that the customer qualifies for special pricing, or has earned a promotional reward. The DII process step could substitute or append a second form of ID, such as a database record number to the transaction record. The

database record number could record the promotional reward status and further request a second DII processing step. This second DII processing step could append from a third data source relevant customer information (i.e. name and address). Any number of DII steps could be requested without limitation. The full transaction record could then be recorded in a database.

5 Using this newly created data record, information could be mailed or the customer otherwise contacted with regards to the promotional reward. At the same time the DII processing is occurring, a service request can be initiated by calling service routine 800. With instructions from the DII settings, including pricing in the system 500 or vending machine the customer is being authorized to use, can be reprogrammed. Upon authorization approval, the vending machine and

10 its performance will be custom programmed for this customer's use.

In another exemplary embodiment, a user presents a first form of ID and desires to use a PC 630. A DII processing step can send instructions to a server controlling a PC 630 or to a PC 630 directly. While the DII processing step is determining if a second form of ID is required and how the transaction should be routed, PC 630 reconfigures the desktop. In such a scenario, the 15 user has been previously allowed to configure the PC 630 as desired to suit processing need and ease of use requirements. The DII step invokes in the PC 630, a reset function to access the user's established profile and reconfigures the PC 630 to the user's settings. In this fashion, a PC 630 user can travel to a PC 630 located in any location of the world and by way of a common network database, reconfigure the PC 630 to his or her preferences. In the scenario where there 20 are thousands of franchised locations desiring to have PC's 630 in thousands of in-store and out-of-store locations, a user can present a first form of ID and have any PC 630 reconfigured to their personal preferences.

In another exemplary embodiment, a user can present a first form of ID at a PC 630. A DII processing step can determine the status of the user (number of previous visits, preferences) 25 and prompt the user to answer customer survey questions. DII processing can route transaction information and customer survey responses to any desired location or database. Additionally, through DII processing, accounts can be established to allow an electronic commerce transaction to occur. Such accounts can include customer identification, customer purchasing history, customer credit limits, other customer information, electronic commerce accounts, payment 30 accounts, shipping accounts, local franchise store locations, local in-store customer account information, transaction processing fees due, and other related account detail. Should a customer desire to purchase products through an electronic commerce transaction from a distribution fulfillment center ("DFC") located anywhere in the world, a DII processing step can effectuate the

transaction. A distribution fulfillment center is any store, manufacturer, warehouse, or other repository of goods and or services from which a customer can purchase, ship, receive, and or order fulfill said goods and services. A pack and ship type company can be a distribution fulfillment center.

5 In addition, a DFC can initiate a transaction and use the DII processing to bill a customer who may have an account accessible by way of the present invention. Such DFC initiated transactions can be particularly useful for billing a group member, club member or customer with an association to a business, store, or group.

10 Any form of ID can be presented to a DII resident on or accessible by a universal server, resident in or accessible by a system 500, resident on or accessible by a vending machine, or resident in a database accessible by a universal server, system 500, or vending machine. If the transaction requires a DII processing step, the step can be performed transparent to the users or with the user's input. Furthermore, the DII can encrypt and decrypt transaction data, whereby secure transaction processing can be accomplished. DII processing can occur locally or remotely
15 worldwide.

Processing in block 910 invokes a routing routine to determine if a DII step is required and where the resultant transaction processing should be routed. Accordingly, a transaction can be DII processed, if necessary, and routed to a transaction processor. Such a transaction processor could be the in-store or hotel PMS/MIS or POS system. If the transaction is a credit
20 card transaction that requires the step of "authorization," "sale," "settlement," or other credit card processing step, the hotel or retailer's PMS/MIS or POS system can complete the processing step. Should the PMS/MIS or POS system be unable to complete these types of transactions, the universal server, system 500 or other data processing device in a network 600 can complete these steps. Processing then moves to block 912.

25 In an exemplary embodiment, secured transaction processing referred to in block 910 can be by way of VISA/MASTERCARD Secure Electronic Transaction ("SET") protocol standard. Furthermore, SET transaction processing can be implemented by way of a system 500, a vending machine, or a universal server. The SET protocol standard for secured transaction processing can be implemented with other data processing equipment accessible by a system 500, vending
30 machine or the universal server.

Processing in block 910 can effectuate the following exemplary embodiment. A customer can enter or check into at hotel or retail outlet, wherein a valid credit card is entered into the hotels or retailer's PMS/MIS system, or POS system. The customer can then be given an ID

form, such as a card, smart card, hotel room key/card, or present another form of ID (biometric). This second form of ID can be entered into the hotel's or retailer's PMS/MIS or POS system. The customer can then present the second ID form to facilitate a vending transaction in any system 500. Transaction information by way of the network 600 can data communicate to the universal 5 server transaction information to obtain first or other ID forms (such as payment or account ID forms). DII processing can then access the hotel's or retailer's PMS/MIS or POS system and obtain the customer's valid credit card or billing information. The credit card or billing data can be appended to the transaction record. The new appended transaction record can then be routed for processing. Transaction processing can include, but is not limited to adding the charges to a 10 hotel bill (folio), paying cash, charging a smart card or credit card, charging an account, or recording the charges in a database.

Processing in block 912 routes PRE-VEND transactions for validation. Transaction validation can occur in a plurality of ways dependent on server programming, hotel/retail outlet preference, as well as based on card type, and/or ID type. Transactions can be validated at a 15 remote location, such as remote location 616 whereby access to remote location 616 is by way of a system 500, network 600, and POS system 614. In addition, transactions can be validated at a remote location, such as remote location 618 whereby access to remote location 618 is by way of a system 500, network 600, and PMS/MIS system 620. Furthermore, transactions can be validated at a remote location, such as remote location 606 by way of a system 500, network 600, 20 and PC 630. Transactions can also be validated at a remote location, such as remote location 634 whereby access to remote location 634 is by way of a system 500, network 600, and server 632. Server 632 is a universal server. Furthermore, transactions can be validated at a remote location, such as remote location 636 whereby access to remote location 636 is by way of a system 500. Additionally, transactions can be validated by way of a database resident in a system 500, a POS 25 system 614, a server 632, or a PMS/MIS system 620. Transactions can also be validated by way of a database accessible by a system 500, a POS system 614, a server 632, a universal server, or a PMS/MIS system 620.

The resultant of the transaction processing is data communicated to the requesting system 500. If the resultant is in the affirmative, the customer is "approved" to use the vending equipment, then the requesting system 500 activates the vending equipment for use by the customer. If the resultant is in the negative, that is the customer has been "declined" for vending machine usage, then the requesting system 500 denies usage of the appropriate vending machine. The customer is notified of the "declined" status by way of LED indicator means 504, voice

record and playback means 570, first display means 582, or other indicators means. Processing then moves back to the calling routine.

Processing in block 914 routes POST-VEND transaction data. POST-VEND transaction data includes PRE-VEND identification data, in addition to the marketing data generated resultant from the vend process.

Examples of PRE-VEND transaction data can include identification, date, time, appended ID data, sale limits, system pricing, merchant identification, routing codes, and system 500 ID codes. Additional PRE-VEND transaction data can include network traffic codes, authorizing sale amounts, system 500 configuration parameters, database access codes, remote location codes, currency codes, terminal codes, and other routing and system operational codes.

Examples of the marketing transaction data can include sale amount, finish date, finish time, total copies, total fax/phone/data port pages or minutes used locally, total fax/phone/data port pages or minutes used long distance, total fax/phone/data phone pages or minutes used internationally, and total fax pages received or calls made. System 500 and network programming can control and monitor local, long distance, and international phone, data port, and or fax delineation. Additional marketing transaction data can include total PC 630 general usage time, PC 630 applications utilized/usage time, PC 630 online usage (site contact specific, service specific, time used per site), total printed output count from a plurality of printers, and total scans made into the PC 630. Additional marketing data can include electronic commerce purchases, phone usage (including time, calls, etc.), smart card re-valued totals, laptop usage, data port usage, and/or other marketing/transaction measurement/indicator data.

Routing of post-vend transaction processing by way of the DII is resultant from the updating of processing databases, accounting databases, and marketing databases in which the DII controls, manages, and/or has access to as shown in block 908. Further, post-vend transaction processing by way of the DII is resultant from post processing of credit cards, smart card and other types of transactions that require an intervening process to effectuate an electronic transfer of funds.

PRE-VEND and POST-VEND transactions can be processed by way of the PC 630 simultaneously and transparently to a user of the same PC 630. This functionality allows the PC 630 to be a vending machine interconnected with a system 500, a universal server such as server 632, PMS/MIS system 620 or a POS system 614. Furthermore, the PC 630 can implement the DII transaction processing as disclosed in block 908 and block 912. Additionally, the PC 630 can implement the DII locally with reliance on a remote site/server over a TCP/IP network, a

Microsoft NT network, a Novell Netware network, an Internet connection, a VSAT connection, or other network interface. Also, the PC 630 can implement the DII residing remotely on a remote site/server over a TCP/IP network, a Microsoft NT network, a Novell Netware network, an Internet connection, a VSAT connection, or other network interface.

5 There is shown in Figure 12, a system self-configuring routine 1000. In an exemplary embodiment, each system 500 or vending machine can be preprogrammed with a network address ID or can have a network address ID automatically assigned. In certain network configurations a preprogrammed network address may be preferable over dynamically assigned network addressing. Both methods can be effectuated with similar results.

10 In an exemplary embodiment of the present invention, a self-configuring routine 1000 is disclosed although other network address schemes could be employed. Processing begins in block 1002, wherein a polling beacon address is incremented. Only unallocated polling beacon addresses are assigned. Processing then moves to block 1004.

15 Processing in block 1004 tests to see if the polling beacon address has reached an upper limit. If the polling beacon address has reached an upper limit, then the polling beacon address is reset to a minimum preset limit or address. Processing then moves to block 1006.

Processing in block 1006 globally transmits over network 600 a unique polling beacon address. Processing then moves to block 1008.

20 Processing in block 1008 waits for data communication responses from systems 500 and/or vending machines on network 600. If a system 500 or vending machine on network 600 has been preprogrammed with a network address, then said system 500 or vending machine data communicates a response to the polling beacon. If, however, a system 500 or vending machine on network 600 has not been preprogrammed, then a system 500 or vending machine desiring a network address can data communicate a response to the polling beacon. A universal server then 25 creates (if not already created) a network configuration database. Data communication can then be conducted on network 600 with any system 500 or vending machine. Network addresses can take the form of Internet IP type addressing.

30 Processing in the system self-configuring routine continues until each system 500 and vending machine has been assigned a valid network address. Processing then returns to the calling routine.

There is shown in Figure 13, a re-value card routine 1100. Processing begins in block 1102, wherein a card is inserted into a card reader/writer, such as smart card reader/writer 548 or magnetic card reader/writer 550. Processing then moves to block 1104.

5 In block 1104, the system data communicates to the universal server the current "status" of the card and the fact that it has been inserted into a system 500. The universal server can then request that a portion or the entire contents of the card to be data communicated to the universal server, or any other device on the network 600. Processing then moves to block 1106.

10 In block 1106, the universal server processes the data communication between the universal server, system 500 (containing the card), and any other device as necessary that is present on network 600. If required, the universal server can request a DII processing step to obtain appropriate or verify transaction data. Processing then moves to block 1108.

15 Processing in block 1108 is responsive to the resultant obtained from processing in block 1106. Furthermore, if a DII response requires additional information, processing in block 1108 prompts the user for such information/data. For example, a user can be prompted to enter, by way of keypad 540, the amount of money/units/credit to transfer to the card or to an account referenced by the card from sources acquired by the DII processing step. If additional data, such as the presentation of a credit card is required to effectuate the transfer of cash value, the customer can be prompted to "swipe" or otherwise present a valid credit card. If the universal server is able to utilize the DII to obtain data required to effectuate transaction processing, a customer may 20 only be asked to "confirm-to-continue" with the transfer. In another exemplary embodiment, the re-valuing by way of the universal server, and/or DII processing can be seamless to the customer and transfers funds (money/credit/units) to the card or to an account referenced by the card without any intervention by the customer. Processing then moves to block 1110.

25 Processing in decision block 1110 effectuates the processing of the transaction and eventual "approval" or "denial" of a request to transfer funds (money/credit/units) to the smart card. If the resultant is in the negative, that is, the transaction has been "denied" then processing returns to the calling routine. If the resultant is in the affirmative, that is, the transaction has been "approved" then processing moves to block 1112.

30 Upon "approval" processing in block 1112 data communicates between the universal server, system 500 containing the card, and any other device (as required) on network 600 to effectuate the transfer of funds (money/credit/units), and subsequent transaction processing (billing "settling" as required). The transaction is then completed, prompting the users to facilitate any final actions as may be required. If the customer desires a receipt of the transaction just

- 40 -

completed, a receipt can be printed by any printer on network 600. Processing control then returns to the calling routine.

There is shown in Figure 14, a help desk routine 1200. Processing begins in block 1202, wherein a user at any system 500 can press a "HELP" or "SERVICE" button or otherwise request assistance. Once a request for assistance has been requested by the customer, the appropriate system 500 data communicates the request for service to the universal server. Alternatively, a help desk can initiate a request for "HELP" or "SERVICE" broadcasting such a request to one or more systems 500 or vending machines. The help desk can intervene, initiating a "HELP" or "SERVICE" request to effect changes/upgrades/repairs to any vending machine, any system 500, any universal server, or any other equipment residing on the network 600. Furthermore, a help desk can intervene, initiating a "HELP" or "SERVICE" request to page a customer in a hotel, retail outlet, or other location in proximity to a system 500 or vending machine. Processing then moves to block 1204.

In block 1204, a data communication between the universal server and the system 500 requesting "HELP" or "SERVICE" occurs. Such a request is resultant in the universal server identifying where and what kind of "HELP" or "SERVICE" is available and data communicating to a different system 500 or network location requesting specific "HELP" or "SERVICE". Processing then moves to block 1206.

In block 1206, the universal server receives the "HELP" or "SERVICE" data communication by way of the calling system 500. The universal server then responds to the requesting system 500, acknowledging the request. The universal server then issues a request for "HELP" or "SERVICE" to the programmed network location where service personnel or data processing equipment reside. The universal server then effectuates the data communication between the user who requested "HELP" or "SERVICE" and the "HELP" or "SERVICE" source.

The term "HELP" or "SERVICE" can include a response to interactive advertising, electronic commerce activities or processes, vending machine usage requests, emergency needs, and other general purpose question and answer requests. The term "LIVE" can include viewing, talking, and exchanging data with another person or data processing equipment by way of a system 500, network 600, or other processing equipment.

"HELP" or "SERVICE" can be by way of "LIVE" interaction with a person or by way of prerecorded voice and/or video available on the universal server, or accessible by the universal server from a remote help desk location. Any system 500 residing on a network 600 can be utilized to data communicate with any other system 500 residing on the network 600 to provide

data communication for "HELP" or "SERVICE" requirements. In addition, any system 500 residing on the network 600 can, by way of the vending machine interconnected with said system 500, such as a PC 630, data communicate with a remote location to obtain "HELP or "SERVICE" data. Then, by way of said system 500 data communicate to the system 500 5 originally requesting "HELP" or "SERVICE". The original system 500 requesting "HELP" or "SERVICE" can be the same system 500 in which an interconnection with a vending machine, such as a PC 630 is relied upon to obtain "HELP" or "SERVICE" from a remote location.

Such a remote help desk can reside on-site or off-site. Such on-site locations can include a front desk of a hotel, a customer service counter of a retail outlet, or a remote location accessible 10 by way of phone, Internet, VSAT, other communication forms. Available help desk information/resources can include voice and/or video data communications.

When a "HELP" or "SERVICE" request is resultant from the help desk discovering that service, change, or an adjustment is required, the prescribed service, change, or adjustment can be made over network 600. Whether the change is to a system 500, the universal server, or any 15 vending machine (for example a PC 630) interconnected with a system 500 changes can be made by way of network 600. Such service, changes, adjustments, upgrades, and repairs can be effectuated by way of the data communication at any time with or without a "HELP" or "SERVICE" request, transparent to the customer.

In an exemplary embodiment, a customer at a personal computer presses the "HELP" 20 button and a message is data communicated to the universal server. If "HELP" can be obtained at a remote site on the Internet, a response to the system 500 sending the "HELP" message would be to access the Internet site and display the "HELP" solution. The universal server could respond to the system 500 requesting the "HELP" message with a network ID location of another system 500 or a geographic location such as the front desk of a hotel or in the security office for resolution to 25 the "HELP" request. Alternatively, the universal server could respond to the system 500 sending the "HELP" message, by data communicating a response comprising voice and video stored on the universal server or accessible by the universal server. Such "HELP" message can include digitized video clips, digitized sound clips, or other digital messages.

In block 1206, the universal server responds with a data communication to the system 500 30 requesting "HELP" and/or "SERVICE". Such a data communication can include network identification and access data/instruction on how and where said system 500 can access and obtain the "HELP" and/or "SERVICE" requested by the user. Such a data communication by the universal server may also be data communicated to a plurality of systems 500. If no "LIVE",

“HELP” or “SERVICE” is available, as may be determined by the universal server, the universal server can data communicate instructive commands with the system 500 requesting “HELP” or “SERVICE”. Such instructive commands can grant access to a database or identifying a database where prerecorded voice and/or video “HELP” or “SERVICE” messages can be retrieved and 5 played to best answer a user question. Processing then moves to block 1208.

In block 1208, voice and/or video data are data communicated between the system 500, by way of the voice record and playback means 570, and/or the video record and playback means 576. When “LIVE” access to a help desk is established, a user can freely talk, listen, and/or view a “LIVE” video feed to obtain instruction and have “HELP” and/or “SERVICE” questions 10 answered. As necessary, the operator of the help desk can access the vending machine (in particular the PC 630) and aid the users in resolving operational, procedural, or other service related problems. Processing then moves to block 1210.

Processing in block 1210 allows a user, a help desk, and/or a universal server to terminate the “HELP” and/or “SERVICE” request. Processing then returns to the calling procedure.

15 There is shown in Figure 15, an advertising routine 1300. Processing begins in block 1302 when a user presents a valid form of ID at a system 500 to begin a transaction. Alternatively, processing in block 1302 can begin by way of a person responding, with a keypad 540 or other system 500 data input, to an advertisement that may be displayed on a system 500 currently not in use.

20 In addition to the processing disclosed in transaction routine 900, the DII can select advertising and other marketing advertisements from a database (remote database or local database). The selection of marketing advertisements can be random or in accordance with a customer profile (individual or by group type). Customer profile parameters can be accessible by the universal server and/or by way of DII process steps.

25 An individual customer profile is a profile for an individual person. A group profile is a profile that is specific to a group (i.e. A particular hotel brand or retail brand). Furthermore, the individual and group type profiles can be the same profile or different profiles. Additionally, DII process steps can selectively choose advertising content in harmony (deduced from the individual or group profiles) at random or in accordance with predetermined universal server programming. 30 Selection of advertising content can be audio only or visual only or a combination of both audio and visual. In the present invention, a “banner” type, “point cast” type, or “multi cast” type advertisement can be displayed on a system 500. In an exemplary embodiment, when a customer desires additional information, audio can be added to the displayed “banner” advertisement to

further inform the customer. Additionally, audio can come in the form of a system 500 generated telephone call to the "banner" advertising source (business that placed the advertisement). "Banner," "point cast," "multi cast" type advertisements are generally graphical advertisements commonly found on Internet web pages. In addition, full snap shot icon type advertisements, as well as full motion advertisements each with or without audio, can be displayed. Furthermore, PC 630 can deliver interactive screen saver advertising as well as each of the other types of advertising disclosed in the present invention. Advertising content displayed on either a system 500 or vending machine, such as PC 630 can be monitored, controlled, distributed, and shown by way of network 600 and a universal server.

10 In addition to the DII processing and data communication of a customer profile, DII processing also processes and data communicates a distribution profile. The distribution profile determines which of the systems 500, in a plurality of systems 500 residing on a network 600 will receive the current advertisement data. A distribution profile can direct advertising to a single system 500 located on the network 600 or to a subset of systems 500 (i.e. all PC 630, all copiers, 15 all fax machines, etc.). Furthermore, the distribution profile can direct advertising to the entire population of systems 500 on the network 600. Processing then moves to block 1304.

Processing in block 1304 distributes the advertisement over the network 600 in accordance with the distribution profile. Processing then moves to block 1306.

20 Processing in block 1306 responds to customer input effectuated in response to any advertisement on any system 500 located on the network 600. At any system 500 on the network 600, a customer/user can elect to buy the advertised item. Other customer's/user's responses can include to "see more" detail about the advertised item, visit a web site, or place a telephone call to the advertiser or information source. Additionally, customer's/user's responses can include 25 printing out detailed information regarding the advertisement, request a sales person to contact the customer/user later, send an Email (electronic mail), or respond to the advertisement as may be supported by the system 500. Processing then moves to block 1308.

30 Processing in block 1308 adds the amount of an electronic commerce purchase to the total of the current transaction. If the customer/user interacted with a system 500 in which no current transaction was in progress, the system 500 by way of the universal server will prompt the user to present a valid form of ID and start a transaction. DII processing can be relied upon to associate any form of valid ID presented to facilitate the electronic commerce purchase. Receipts or other printed documents, such as order forms or conformation forms can be printed on a printer on network 600 as required. Processing control is then returned to the call procedure.

- 44 -

There is shown in Figure 16, a print routine 1400. Processing begins in block 1402 when a system 500 desires to print data on a printer, such as printer 612A or printer 612B. In an exemplary embodiment, print data can be advertisement print data, transaction summary print data, receipt print data, vending machine print data, such as from a PC 630, or other print data.

5 If a system 500 is preprogrammed with a network 600 network location ID (network address) for a printer 612A or 612B, then printing on printer 612A or 612B can be facilitated by way of a data communication between the system 500 and printer 612A or printer 612B. Subsequent to any printing, a data communication between the system 500 desiring to print and the universal server can occur, wherein the system 500 desiring to print data requests permission from the universal
10 server to data communicate print data to printer 612A or 612B. If permission is granted and printing is successful, processing control returns to the calling procedure. If processing is not successful, then processing moves to block 1404.

15 Processing in block 1404, determines if the system 500 desiring to print data is preprogrammed with a network 600 location ID (network address) to facilitate remote access to the printer 612A or 612B. Additionally, processing in block 1404 tests to see if an attempt to print to printer 612A or 612B was unsuccessful (printer off-line, out-of-paper, etc.). In either case, a request as to "where to send the print data" is data communicated to the universal server. Processing then moves to block 1406.

20 In block 1406, a response from the universal server is data communicated to any system 500 requesting "where to send the print data". If a printer is available, the universal server can respond by sending the requesting system 500 a data communication including the network 600 location ID where print data can be data communicated. If no printer is available, or the universal server desires to capture the print data, the universal server can data communicate to the system 500 requesting to data communicate print data, the instructions to send the print data to the
25 universal server. Processing then moves to block 1408.

30 In block 1408, the system 500 desiring to print data, communicates the print data in accordance with instructions received from the universal server. If there is an available printer, the universal server can direct the system 500 desiring to print data to print data on the available printer. If the universal server determines that there is not an available printer, or desires to capture the print data the universal server can accept the print data. If the universal server captures the print data, the print data can be saved, save to be printed later, and/or redirected to a network 600 destination. Furthermore, print data can be redirected to a remote location, such as remote location 606, 616, 618, 634, and/or 636. Processing then moves to decision block 1410.

- 45 -

Processing in decision block 1410 determines if the print data was successfully data communicated. If the resultant is in the affirmative, that is, the print data was either printed or data communicated without error then processing control returns to the call procedure. If the resultant is in the negative, processing control moves back to block 1404, wherein the universal server can intervene to best complete the print data request.

There is shown in Figure 17, a POST-VEND transaction processing routine 1500. Processing begins in block 1502, wherein a POST-VEND transaction is data communicated to the universal server. Processing then moves to block 1504.

In block 1504, the universal server, by way of DII processing (as required) routes the POST-VEND transaction for payment, posting, or billing. The process of payment, posting or billing is generally referred to as "settling" or a "settlement" transaction. Transactions can be routed based on transaction type (credit card, smart card, pre-paid card, hotel key/card, or biometric) to different remote locations, or to different on-site or off-site databases. Furthermore, post-vend transactions can be routed based upon preprogrammed criteria. For example, all credit card transactions requiring "settlement" can be routed to a first credit bureau until a certain gross daily, monthly, annual dollar amount is achieved. Once the preprogrammed criterion has been satisfied credit card transactions requiring "settlement" can then be routed to a second credit bureau. Processing then moves to block 1506.

In block 1506, non-credit card and POST-VEND transactions not requiring any additional third party port processing (i.e. by way of a credit bureau) are "settled" by posting the POST-VEND transaction data, by way of DII processing (as required) to the appropriate remote location, or on-site or off-site database. The universal server can be preprogrammed to store POST-VEND transactions and "batch" post transaction data based on a preprogrammed criteria. Such "batch" posting preprogrammed criteria can be based in part on date, time, or quantity of transactions, transaction dollar amount, availability of the database or remote location, or other cost, performance or preferences. The term "batch" processing is defined as the process of posting any number of transactions at once in a formatted block of data. Processing then moves to block 1508.

In block 1508, POST-VEND transactions reliant on a third party processor (i.e. credit cards) are processed in accordance with preprogramming of the universal server. Preprogramming of the universal server can include processes and procedures disclosed in block 1504, and 1506. Processing then moves to block 1510.

- 46 -

In block 1510, the universal server determines whether the POST-VEND transaction processing was successful. If the POST-VEND transaction processing was not successful, that is, the universal server was unable to post process the POST-VEND transaction, then the universal server can data communicate the "unsettled" post vend transaction to a remote locate. Such a 5 remote location can be a computer center that monitors the functionality of a plurality of universal servers. The remote location can be remote location 606, 616, 618, 634, or 636. Processing control is then returned to the calling procedure.

There is shown in Figure 18, an error detection routine 1600. Processing begins in block 1602, wherein a test is performed. A test is performed to determine if a preprogrammed number 10 of hours have elapsed. Each hour a system 500 or a vending machine interconnected with a system 500 is not operated successfully (a complete vend cycle) by a customer, a non-use timer is incremented. When a preprogrammed number of non-use hours has occurred, an error message can be generated by a system 500 and data communicated to the universal server. Alternatively, the universal server can generate an error message. In either case, the universal server can record 15 the non-use error message and can act as appropriate and programmed to respond. Processing then moves to block 1604.

Processing in block 1604, detects if a malfunction has occurred with a system 500, a vending machine interconnected with a system 500, or a printer, such as printer 612A or 612B. Other vending machines and data processing equipment on network 600 can also be tested for 20 malfunctions. Malfunction error messages that are detected by a system 500 can be data communicated to the universal server. Malfunctions determined by the universal server are also recorded. In either case, the universal server can record the error message and can act as appropriate and programmed to respond. Processing then moves to block 1606.

Processing in block 1606, allows a remote location, such as remote location 606, 616, 25 618, 634, or 636 to poll the universal server for any error conditions that may have been detected or may exist on a network 600 controlled by the universal server. Furthermore, when a request from a remote location to a universal server is data communicated the universal server can poll each system 500 on a network 600. The polling is equivalent to requesting each system 500 to perform a self-test, and to perform a test to determine if the vending machine interconnect with 30 said system 500 is operating correctly. Processing then moves to block 1608.

In block 1608, processing of a detected error condition occurs. The universal server can processes error condition messages in accordance with a hierarchy of error types and severity criteria. Error types that are classified as "severe" can cause the universal server to data

communicate with a remote location, such as remote location 606, 616, 618, 634, or 636 immediately upon the error being detected. An example of an error type that may be classified as "severe" can be a breach of security detected by way of an alarm means 524.

5 An error type classified and "not severe" can be stored in the universal server or in a database that the universal server has access to until such time a regular, or normally scheduled data communication occurs with a remote location. An example of a "not severe" error can be a printer 612A, or 612B "out-of-paper" condition.

10 Error conditions whether "severe" or "not severe" can trigger a system 500 located on network 600 to alert customer service, or other technical personal to correct the error. For example, an error signal can be audio produced at a front desk or security office, should an error, such as a breech of security be detected. In addition, the universal server can route different types of error messages to different locations. For example, a service related error can result in an electronic fax being sent to a remote service location, and a breech in security error can be routed to a security office. Processing then returns to the call procedure.

15 While this invention has been described with reference to specific embodiments, it is not necessarily limited thereto. Accordingly, the appended claims should be construed to encompass not only those forms and embodiments of the invention specifically described above, but to such other forms and embodiments, as may be devised by those skilled in the art without departing from its true spirit and scope.

What is claimed is:

1. An electronic commerce terminal operationally related to a phone for transacting electronic mail, electronic commerce, and electronic business and for communicating voice, and data comprising:

5 a controller;

a telephone interface control means for controlling the usage of a telecommunication line;

a display means interconnected with said controller for displaying information; and

10 an interactive user response system interconnected with said controller for allowing a user to interactively data communicate to local or remote locations, wherein at least one of the following can be communicated or transacted: a voice, a plurality of data, an electronic mail, an electronic commerce transaction, and or an electronic business transaction.

15 2. An electronic commerce terminal in accordance with claim 1, wherein said display means displays interactive advertising and information related to the processing of said electronic mail, said electronic commerce transaction, and or said electronic business transaction.

3. An electronic commerce terminal in accordance with claim 1, wherein said electronic commerce terminal is a public phone.

20 4. An electronic commerce terminal in accordance with claim 1, wherein said electronic commerce terminal is a private phone.

5. An electronic commerce terminal in accordance with claim 1, wherein said electronic commerce terminal is a cellular phone.

25 6. An electronic commerce terminal in accordance with claim 1, wherein said electronic commerce terminal is a transaction control device.

7. An electronic commerce terminal in accordance with claim 1, wherein said electronic commerce terminal is a debit card terminal.

8. An electronic commerce terminal in accordance with claim 1, wherein said electronic commerce terminal is a credit card terminal.

9. An electronic commerce terminal in accordance with claim 1, wherein said electronic commerce terminal is a personal computer.

10. An electronic commerce terminal in accordance with claim 1, wherein said electronic commerce terminal is a network PC.

5 11. An electronic commerce terminal in accordance with claim 1, wherein said electronic commerce terminal is a coin and or cash acceptor.

12. The electronic commerce terminal in accordance with claim 1, further comprising a plurality of communication means interconnected with said controller for data communicating between data communicating devices.

10 13. An electronic commerce terminal in accordance with claim 12, wherein said plurality of communications means includes a VSAT interface.

14. An electronic commerce terminal in accordance with claim 12, wherein said plurality of communications means includes an ISDN interface.

15 15. An electronic commerce terminal in accordance with claim 12, wherein said plurality of communications means includes an ADSL interface.

16. An electronic commerce terminal in accordance with claim 12, wherein said plurality of communications means includes a local area network interface.

17. An electronic commerce terminal in accordance with claim 12, wherein said plurality of communications means includes a wireless communication interface.

20 18. An electronic commerce terminal in accordance with claim 12, wherein said plurality of communications means includes a carrier current interface.

19. An electronic commerce terminal in accordance with claim 12, wherein said plurality of communication means is a T1 telecommunication interface.

25 20. An electronic commerce terminal in accordance with claim 12, wherein said plurality of communications means includes a TCP/IP network interface.

21. An electronic commerce terminal in accordance with claim 12, wherein said plurality of communications means includes a wireless communication interface.

22. An electronic commerce terminal in accordance with claim 12, wherein said plurality of communications means includes a dedicated hardwired interface.

23. An electronic commerce terminal in accordance with claim 12, wherein said plurality of communications means includes an analog telephone line interface.

24. An electronic commerce terminal in accordance with claim 1 wherein said interactive user response system includes a touch screen.

5 25. An electronic commerce terminal in accordance with claim 1, wherein said interactive user response system includes a plurality of pushbuttons.

26. An electronic commerce terminal in accordance with claim 1 further comprising an infrared communication means, for communicating with other said terminals and or other data communicating equipment.

10 27. An electronic commerce terminal in accordance with claim 1, further comprising a magnetic card reader, whereby magnetic cards, phone cards, credit cards, smart cards, debit cards, pre paid cards, automated teller cards, or other bank and or private label cards can be read by said magnetic card reader.

15 28. An electronic commerce terminal in accordance with claim 1, further comprising a modem

29. An electronic commerce terminal in accordance with claim 1, further comprising a first communication means.

30. An electronic commerce terminal in accordance with claim 1, further comprising a second communication means.

20 31. An electronic commerce terminal in accordance with claim 1, further comprising a light emitting diode indicator means for optically communicating a plurality of status conditions.

32. An electronic commerce terminal in accordance with claim 1, further comprising an equipment control means for controlling usage of a vending machine.

25 33. An electronic commerce terminal in accordance with claim 32, further comprising a vend counter control means for monitoring, counting, and controlling cycle event of said vending machine.

34. An electronic commerce terminal in accordance with claim 1, further comprising a mouse/keyboard control means for controlling usage of a personal computer.

35. An electronic commerce terminal in accordance with claim 1, further comprising a printer/modem control means for controlling usage of a printer.

36. An electronic commerce terminal in accordance with claim 1, further comprising a hardware security interface means.

5 37. An electronic commerce terminal in accordance with claim 1, further comprising a voice/handwriting capture and recognition means.

38. An electronic commerce terminal in accordance with claim 1, further comprising a biometric reader means.

10 39. An electronic commerce terminal in accordance with claim 16, wherein said local area network means can interface to a property management information system.

40. An electronic commerce terminal in accordance with claim 16, wherein said local area network means can interface to a management information system.

41. The electronic commerce terminal in accordance with claim 16, wherein said local area network interface is an interface to a universal server.

15 42. An electronic commerce terminal in accordance with claim 16, wherein said local area network interface can interface to a point of sale system.

43. An electronic commerce terminal in accordance with claim 1, wherein said interactive user response system is further comprised of a speaker and a microphone interconnected with a transaction control device, to communicate audio for audio conferencing.

20 44. An electronic commerce terminal in accordance with claim 1, wherein said interactive user response system is further comprised of a camera interconnected with a transaction control device, to communicate video for video conferencing.

25 45. A method of transacting an electronic mail, an electronic commerce transaction, and or an electronic business transaction by an electronic commerce terminal, said electronic commerce terminal being operationally related to a telephone comprising the steps of:

- a) capturing a plurality of transaction data;
- b) identifying a transaction type based on said transaction data;
- c) evaluating the validity of said transaction type;
- d) communicating said transaction data; and

5 e) processing said transaction data.

46. A transaction processing method in accordance with claim 45, further including the step of determining if a dynamic identification interchange step is required based on said transaction data whereby said transaction data can undergo a swap data step, an append data step, a convert data step, a route data step, and or a process data step.

10 47. A method of processing said transaction data in accordance with claim 45, wherein said electronic mail is sent or received.

48. A method of processing said transaction data in accordance with claim 45, wherein said electronic commerce transaction is further processed.

15 49. A method of processing said transaction data in accordance with claim 45, wherein said electronic business transaction is further processed.

50. A method of processing said transaction data in accordance with claim 45, wherein public transportation information is sent or received.

15 51. A method of processing said transaction data in accordance with claim 45, wherein financial service information is sent or received.

52. A phone card revaluing method for altering the value a phone card by way of an electronic commerce terminal system comprising the steps of:

20 a) detecting a phone card has been inserted or swiped in a card reader;

b) retrieving a plurality of transaction data from said smart card;

c) communicating said transaction data to a universal server;

d) evaluating the validity of said transaction data; and

e) processing said transaction data.

25 53. A phone card revaluing method in accordance with claim 52, wherein, after the step of communicating said transaction data to a universal server, the user is prompted to enter a desired revalue amount.

54. A phone card revaluing method in accordance with claim 52, wherein the step of communicating said transaction data to a universal server can include a dynamic identification interchange step to convert said transaction data by way of a swap data step, an append data step, a convert data step, a route data step, and or a process data step.

55. A method of providing an help desk by way of an electronic commerce terminal, said electronic commerce terminal being operationally related to a phone, comprising the steps of:

- a) initiating a help or service request;
- b) communicating said help or service request to a universal server;
- c) allowing said universal server to render said help or service when said help or service request can be resolved by said universal server;
- d) allowing said universal server to request said help or service from another data communicating device when said help of service request can not be resolved by said universal server;
- e) communicating data, and or video data, and or audio data from a data communicating device to said electronic commerce terminal system requesting said help or service; and
- f) terminating said help or service request.

56. A method of printing data by way of an electronic commerce terminal, said electronic commerce terminal being operationally related to a phone comprising the steps of:

- a) determining a plurality of print data;
- b) determining if said electronic commerce terminal system is preprogrammed with a network address to send said print data;
- c) determining where said print data will be data communicated; and
- d) communicating said print data.

57. A printing data method in accordance with claim 56, wherein determining what data to print includes at least one of the following: electronic mail related data, electronic commerce related data, electronic business related data, advertising information, transaction information, phone data, Internet data, or general purpose data.

58. A method of processing post vend transaction data by way of an electronic commerce terminal, said electronic commerce terminal being operationally related to a phone comprising the steps of:

- a) data communicating said post vend transaction data to a universal server;

- 5 b) determining whether post vend transaction routing is required;
- c) routing said post vend transaction data for settlement when required;
- d) routing said post vend transaction data for posting when required;
- e) processing said post vend transaction data in accordance with said universal server's programmed settings; and
- f) determining if said post vend transaction data processing was successful.

59. A dynamic identification interchange method for exchanging one form of identification for another form of identification by way of an electronic commerce terminal, said electronic commerce terminal being operationally related to a phone comprising the steps:

- 10 a) obtaining a plurality of transaction data;
- b) data communicating said transaction data to a universal server, whereby said transaction data can undergo by way of said dynamic identification interchange a swap data step, an append data step, a convert data step, a route data step, or a process data step; and
- c) returning the resultant of step b for further processing.

60. A method of servicing a request from a universal server, a property management system, a point of sale system, a management information system, a personal computer, and or a user by way of an electronic commerce terminal, said electronic commerce terminal being operationally related to a phone system comprising the steps of:

- 20 a) determining if a service condition has been requested;
- b) responding to said service condition by data communicating an acknowledge;
- c) determining whether data communications with the universal server is required to resolve the service request;
- d) communicating data with said universal server to resolve the service request when required; and
- e) resolving said service condition.

61. A carrier including a computer program, when executed by a processor, causing the processor to perform a transaction by an electronic commerce terminal, said electronic

commerce terminal being operationally related to a telephone, the computer program causing the computer to perform the steps of:

- a) capturing a plurality of transaction data;
- b) identifying a transaction type based on said transaction data;
- c) evaluating the validity of said transaction type;
- d) communicating said transaction data; and
- e) processing said transaction data.

5 62. The electronic commerce terminal in accordance with claim 1, further comprising a room key/card interface.

10 63. The electronic commerce terminal in accordance with claim 1, further comprising a debit card prepaid card reader/writer.

64. The electronic commerce terminal in accordance with claim 1, further comprising a smart card reader/writer.
